It is not to be confounded with the general views of the development or evolution of the visible order of nature which have been entertained by philosophers from the earliest times. (See *evolution*.) That which is specially and properly Darwinian in the general theory of evolution relates to the manner, or methods, or means by which living organisms are developed or evolved from one another: namely, the inherent susceptibility and tendency to variation according to conditions of environment; the preservation and perfection of organs best suited to the needs of the individual in its struggle for existence; the perpetuation of the more favorably organized beings, and the destruction of those less fitted to survive; the operation of natural selection, in which sexual selection is an important factor; and the general proposition that at any given time any given organism represents the result of the foregoing factors acting in opposition to the hereditary tendency to the type, or "breed true." See *selection*

=**Syn.** *Dash*, *Smash*, *Shatter*, *Shiver*, *Crush*, *Mash*. That which is *dashed* does not necessarily go to pieces: if it is broken, the fact is commonly expressed. That which is *smashed*, *shattered*, or *shivered* is dashed to pieces suddenly, with violence, at a blow or in a collision. *Smashing* is the roughest and most violent of the three acts; the word expresses the most complete disruption or ruin: as, the drunken soldier *smashed* (*shattered*, *shivered*) the mirror with the butt of his musket. The use of *smash* or *mash* for *crush* (as, his head was *smashed*, I *mashed* my finger) is colloquial. *Shatter* and *shiver* differ in that *shatter* suggests rather the flying of the parts, and *shiver* the breaking of the substance; and the pieces are more numerous or smaller with *shiver*. That which is *crushed* or *mashed* is broken down under pressure; that which is *mashed* becomes a shapeless mass: sugar and rock are *crushed* into powder, small particles, or bits; apples are *crushed* or *mashed* into pulp in making cider; boiled potatoes are *mashed*, not *crushed*, in preparing them for the table.

They that stand high have many blasts to shake them;

7. (*a*) In *writing* and *printing*, a horizontal stroke or line of varying length, used as a mark of punctuation and for other purposes; specifically, in *printing*, a type the face of which consists of such a line. The dashes regularly furnished in a font of type are called respectively the *em dash* (—, a square of the size of the font), the *en dash* (–, half a square), the *two-em dash* (⸺, two squares), and the *three-em dash* (⸻, three squares). In punctuation, the em dash is used to note a sudden transition or break of continuity in a sentence, more marked than that indicated by a comma, and also at the beginning and end of a parenthetical clause—properly of one more directly related to the general sense than a true parenthesis. (See *parenthesis*.) The em or the en dash is often used to indicate the omission of the intermediate terms of a series which are to be supplied in reading, being thus often equivalent to "to . . . , inclusive": thus, Mark iv. 3—20, or 3–20 (that is, verses 3 to 20, inclusive); the years 1880–88 (that is, 1880 to 1888). As a mark of hiatus or suppression, the dash—usually one of the longer ones—stands for something omitted, as a name or part of a name, the concluding words of an unfinished sentence, or the connecting words of a series of broken sentences. Various other more or less arbitrary uses are made of dashes, as in place of *do.* (*ditto*) to indicate repetition of names in a catalogue or the like, as a dividing line between sections, articles, or other portions of matter, etc.

Observe well the *dash* too, at the end of this Name.
Wycherley, Plain Dealer, v. 1.

(*c*) In harpsichord-music, a coulé (which see).—9. In *zoöl.*, a longitudinal mark, generally rounded and clearly defined at one end, and tapering or gradually becoming indistinct at the other, as if produced by a drop of colored liquid dashed obliquely against the surface, or by the rough stroke of a pen. Such marks are very common on the wings of the *Lepidoptera*.—10. A present made by a trader to a chief on the western coast of Africa to secure permission to traffic with the natives.—11. Dasypodidæ (das-i-pod'i-dē), *n. pl.* [NL., < *Dasypus* (*-pod-*) + *-idæ.*] A South American family of loricate edentate quadrupeds; the armadillos. It was formerly conterminous with the suborder *Loricata* of *Edentata*; it is now, by the exclusion of *Tatusiidæ* and *Chlamydophoridæ*, restricted to the typical armadillos, having the fore toes variously modified and disproportionate in length to one another, the second being the longest, the third, fourth, and fifth variously shortened; the head broad behind; and the ears far apart. There are four subfamilies: *Dasypodinæ* (the encouberts), *Xenurinæ* (the kabassous), *Prionodontinæ* (the kabalassous), and *Tolypeutinæ* (the apars). Also *Dasypidæ*.

Dasypodinæ (das-i-pō-dī'nē), *n. pl.* [NL., < *Dasypus* (*-pod-*) + *-inæ.*] The typical subfamily of the *Dasypodidæ*, containing the encoubert, peludo, etc. They have the anterior and posterior divisions of the carapace well marked · the tail with a zonular sheath; the teeth moderate in number (9 or 10 on each side above and below); and the first to the third metacarpal regularly graduated in length, the third being the longest, and the fourth and fifth much shortened. The genera are *Dasypus* and *Euphractus*. See cuts under *apar* and *armadillo*.

dasypodine (da-sip'ō-din), *a.* and *n.* **I.** *a.* Pertaining to or having the characters of the *Dasypodinæ*.

II. *n.* One of the *Dasypodinæ*, as the peludo, *Dasypus villosus*.

Dasyprocta (das-i-prok'tä), *n.* [NL., < Gr. *δασύπρωκτος*, with hairy buttocks, < *δασύς*, hairy, + *πρωκτός*, the buttocks.] The typical genus of the family *Dasyproctidæ*. It includes the whole of the family except the pacas, and is characterized by having only 3 developed toes on the hind feet. It comprehends all the agoutis and the acouchy, as the yellow-rumped agouti (*D. agouti*), Azara's agouti (*D. azaræ*), and the acouchy (*D. acouchy*). *D. acouchy* inhabits some of the West Indies as well as South America; the other species of the genus are confined to South America. See cuts under *acouchy* and *agouti*.

dasyproctid (das-i-prok'tid), *n.* A rodent of the family *Dasyproctidæ*.

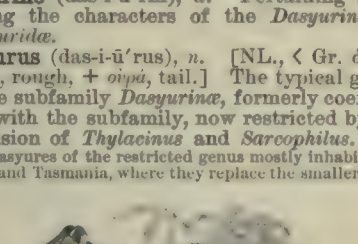
Dasyproctidæ (das-i-prok'ti-dē), *n. pl.* [NL., < *Dasyprocta* + *-idæ.*] A family of simplicident rodents, of the hystricine series, consisting of the two genera *Cœlogenys* and *Dasyprocta*,

the former of which contains the paca alone (*C. paca*), the latter the agoutis. The nails of the feet are hoof-like; the fore feet are 5-toed; the hind feet have also 5 toes (paca), or only 3 (agoutis); the tail is rudimentary or very short; the ears are low; and the upper lip is not cleft. Contrary to the rule in the hystricine series of rodents, the clavicles are rudimentary; and the molar teeth are semi-rooted, and the incisors long. The *Dasyproctidæ* are related to the cavies and chinchillas (see *cavy* and *chinchilla*); they are confined to the Neotropical region, inhabiting parts of Mexico, some of the West Indies, and the greater part of South America, especially wooded and watered localities. See cuts under *agouti* and *Coelogenys*.

Dasypus (das'i-pus), *n.* [NL., < Gr. δασύπους, hairy- or rough-footed; used only as a noun, a hare, rabbit; < δασύς, hairy, rough, + πούς (ποδ-) = E. *foot*.] A genus of armadillos, formerly conterminous with the family *Dasypodidæ*, now restricted to certain species of the subfamily *Dasypodinæ* (which see). See also cut under *armadillo*.

Dasyrhamphus (das-i-ram'fus), *n.* [NL. (Hombron and Jacquinot, 1846), < Gr. δασύς, shaggy, hairy, + ῥάμφος, beak, snout.] A genus of penguins, of the family *Spheniscidæ*: so called from having the bill extensively feathered. The only species is *D. adeliæ*, of the antarctic seas.

dasytes (das'i-tēz), *n.* [NL., < Gr. δασύτης, hairiness, roughness, < δασύς, hairy, rough: see *Dasya*.] 1. In *zoöl.*, hairiness; hirsuteness; a growth of hair on some part not usually hairy. —2. [*cap.*] In *entom.*, a genus of beetles, of the family *Cleridæ*.



dasyure (das'i-ūr), *n.* [< *Dasyurus*.] An animal of the subfamily *Dasyurinæ*.—**Thylacine dasyure.** See *Thylacinus* and *thylacine*, *n.* —**Ursine dasyure**, the Tasmanian devil. See *Sarcophilus*.

Dasyuridæ (das-i-ū'ri-dē), *n. pl.* [NL., < *Dasyurus* + *-idæ*.] A family of polyprotodont marsupial mammals. They have 4 incisors in each half of the upper and 3 in each half of the lower jaw; the canines well developed; the hind feet with the clawless hallux small and rudimentary, rarely apposable; the limbs of proportionate length; the stomach simple; and no cæcum. They are predatory carnivorous or insectivorous marsupials of Australia, Tasmania, New Guinea, and some other islands. They are divided into the two subfamilies *Dasyurinæ* and *Myrmecobiinæ*. These animals are sometimes known indiscriminately as brush-tailed opossums.

Dasyurinæ (das″i-ū-rī'nē), *n. pl.* [NL., < *Dasyurus* + *-inæ*.] A subfamily of *Dasyuridæ*; the dasyures. The tongue is not specially extensile, and the premolars and molars are not more than 7 in number; in these respects the subfamily is contrasted with *Myrmecobiinæ* (which see). The leading genera are *Dasyurus*, *Sarcophilus*, and *Thylacinus*, or the true, the ursine, and the thylacine dasyures, and *Phascogale*; the last is properly made the type of a different subfamily, *Phascogalinæ*.

dasyurine (das-i-ū'rin), *a.* Pertaining to or having the characters of the *Dasyurinæ* or *Dasyuridæ*.

Dasyurus (das-i-ū'rus), *n.* [NL., < Gr. δασύς, hairy, rough, + οὐρά, tail.] The typical genus of the subfamily *Dasyurinæ*, formerly coextensive with the subfamily, now restricted by the exclusion of *Thylacinus* and *Sarcophilus*. The true dasyures of the restricted genus mostly inhabit Australia and Tasmania, where they replace the smaller predatory carnivorous quadrupeds of other countries, such as cats and mustelines and viverrines. There are several species. The dental formula is: 4 incisors in each half of the upper and 3 in each half of the lower jaw; 1 canine, 2 premolars, and 4 molars in each half jaw. The vertebral formula is: cervical, 1; dorsal, 13; lumbar, 6; sacral, 2; caudal, 18 or more. The fore feet are 5-toed, but the hallux is absent from the hind feet.

He is generally a bishop, and is assisted by a subdatary, who is also in holy orders. When a cardinal is elected to the office of datary he bears the title of *prodatary*. See *datary*[2].

That part of a writing or an inscription which purports to specify the time when, and usually the place where, it was executed. A full date includes the place, day, month, and year; but in some cases the date may consist of only one or two of these particulars, as the year on a coin. In letters the date is inserted to indicate the time when they are written or sent; in deeds, contracts, wills, and other papers, to indicate the time of execution, and usually the time from which they are to take effect on the rights of the parties; but the written date does not exclude evidence of the real time of execution or delivery, and consequent taking effect. In documents the date is usually placed at the end, but may be at the beginning, as it is now generally in letters.

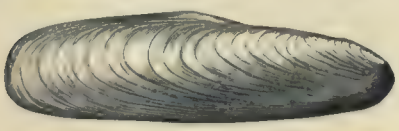
date-line (dāt'lin), *n.* The boundary-line between neighboring regions where the calendar day is different. This line runs through the Pacific ocean, and is supposed to coincide with the meridian of 12 hours or 180° from Greenwich; but it practically follows a somewhat devious course, and is sometimes confused. Thus the Sundays of the Russian and of the American settlers in Alaska formerly fell upon different days. On the east of the date-line the nominal date is one day earlier than on the west of it; so that the American Sunday in Alaska coincides with the former Russian Monday.

date-mark (dāt′märk), *n.* A special mark stamped on an article of gold or silver to indicate the year of manufacture. Thus, in the London Goldsmiths' Company, during the twenty years from 1856 to 1875 this mark was a letter of the alphabet in small Old English character; for the next twenty years, beginning in 1876 and ending in 1895, Roman capitals were adopted.

date-palm (dāt′päm′), *n.* The common name of *Phœnix dactylifera*, the palm-tree of Scripture: also called *date-tree*. Next to the cocoanut-tree, the date is unquestionably the most interesting and useful of the palm tribe. As with the cocoanut-tree, nearly every part is applied to some useful purpose, and the fruit not only affords the principal food of the inhabitants of various countries, but is a source of a large part of their traffic. It is cultivated in immense numbers all over the northern part of Africa as well as in southwestern Asia, and is found through southern Europe, though rarely productive there. Its stem shoots up to the height of from 60 to 80 feet, without branch or division, and is of nearly the same thickness throughout its length. From the summit it throws out a magnificent crown of large feather-shaped leaves, and a number of spadices, each of which in the female plant bears a bunch of from 180 to 200 dates, each bunch weighing from 20 to 25 pounds. The fruit is eaten fresh or dried. The best dates of commerce are obtained from the coasts of the Persian gulf, where the tree is cultivated with great care, and where over 100 varieties are known. The date-palm was probably originally derived from the wild date-palm, *P. sylvestris*, which is found throughout India, and is planted very extensively in Bengal, chiefly for the production of toddy and sugar. See *Phœnix*.



Date-palm (*Phœnix dactylifera*).

date-plum (dāt′plum), *n.* A name for the edible fruit of several species of the genus *Diospyros*, and also for the trees. See *Diospyros*.

It includes two species, one of which is found in southern California, and the other, *D. cannabina*, an herbaceous dioecious perennial, is a native of the southern parts of Europe, where it is used as a substitute for Peruvian bark, as a yellow dye, and in the manufacture of cordage.

Datiscaceæ (dat-is-kā′sē-ē), *n. pl.* [NL., < *Datisca* + *-aceæ*.] A small natural order of plants, with apetalous flowers, but having closer affinities with the *Cucurbitaceæ* and *Begoniaceæ* than with any of the apetalous orders, and united by Baillon with the *Saxifragaceæ*. There are only three genera, of which *Datisca* is the best-known.

datiscin (da-tis′in), *n.* [< *Datisca* + *-in*[2].] A substance ($C_{21}H_{22}O_{12}$) having the appearance of grape-sugar, first extracted by Braconnot from the leaves of *Datisca cannabina*. It has been used as a yellow dye.

datisi (da-tī′sī), *n.* The mnemonic name given by Petrus Hispanus to that mood of the third figure of syllogism in which the major premise is universal and affirmative, and the minor premise and conclusion are particular and affirmative. These distinctions of quantity and quality are indicated by the vowels of the word, *a-i-i*. The letter *s* after the second vowel shows that the mood is reduced to direct reasoning by the simple conversion of the minor, and the initial *d* shows that the resulting mood is darii. The following is an example of a syllogism in datisi: All men irrationally prejudiced have weak minds; but some men irrationally prejudiced are learned; hence, some learned men have weak minds.

This case is found in all the ancient languages of our family, and is widely preserved even among the later. Though nowhere distinguished in form from the accusative or objective in modern English, it is really present in such expressions as, give *him* his due; show this *man* the way; and *him*, *whom*, *them*, and (in part) *her* are historically datives, retaining a dative termination. The precise value of the original Indo-European dative is a matter of doubt and dispute. Abbreviated *dat.*

It is found in Norway, the Tyrol, and Italy, and in fine crystals in New Jersey, Connecticut, and the Lake Superior mining-region. Haytorite is a pseudomorph of chalcedony after datolite. A fact either indubitably known or treated as such for the purposes of a particular discussion; a premise.—3. A position of reference, by which other positions are defined.

3. The whole time or period of one revolution of the earth on its axis, or the space of twenty-four hours; specifically, the interval of time which elapses between two consecutive returns of the same terrestrial meridian to the sun. In this latter specific sense it is called the *natural*, *solar*, or *astronomical day*. Since the length of this day is continually varying, owing to the eccentricity of the earth's orbit and the obliquity of the ecliptic, a *mean solar day* (the *civil day*) is employed, which is the average period of one revolution of the earth on its axis relative to the sun's position considered as fixed. The day of twenty-four hours may be reckoned from noon to noon, as in the *astronomical* or *nautical day*, or from midnight to midnight, as in the *civil day* recognized in the United States, throughout the British empire, and in most of the countries of Europe. The Babylonians reckoned the civil day from sunrise to sunrise; the Umbrians, from noon to noon; the Athenians and Hebrews, from sunset to sunset; and the Romans, from midnight to midnight.

Its use in such names, following the name proper, and preceding what was originally, in most cases, the name of an estate, led to its acceptance as evidence of noble or gentle descent, corresponding in this to the German *von* and the Dutch *van*. But as the particle in proper names often originated without any such implication, and has also been often assumed without authority, it is in itself of no value as such evidence.

2. A Latin preposition, meaning 'from' or 'of,' occurring in certain phrases often used in English: as, *de novo*, anew; *de facto*, of fact; *de jure*, of right.

(2) Completive — 'through, out, to the end,' etc. (3) Intensive: a force often lost in English. (See examples following.) In some words the separative or privative force of this prefix is felt in English, as in *decompose*, *denote*, being in such meaning often used as an English prefix (*de-* privative), as in *decentralize*, *de-Saxonize*, *derail*, etc. It is less distinctly felt in words like *depress*, *detract*, etc.; and in many words, where it has in Latin the completive or intensive force, its force is not felt in English, as in *deride*, *denote*, etc.

Sw. *diakonus*, deacon), = OF. *diacne*, *diacre*, F. *diacre* = Pr. *diacre*, *diague* = Sp. *diácono* = Pg. It. *diacono*, < LL. *diaconus* = Goth. *diakaunus*, a deacon, < Gr. διάκονος, a servant, waitingman, messenger, eccles. a deacon; of uncertain origin; perhaps related to διώκειν, pursue, cause to run. The Teut. forms appear to have been in part confused with the forms belonging to L. *decanus*, a dean (see *dean*[2]), and with those belonging with G. *degen*, etc., AS. *thegn*, E. *thane* (see *thane*).] 1. *Eccles.*, one of a body of men, either forming an order of the ministry or serving merely as elected officers of individual churches, whose chief duty is to assist a presbyter, priest, or other clergyman, especially in administering the eucharist and in the care of the poor. (*a*) In the apostolic church, one of an order of ministers or church-officers, inferior to apostles and presbyters, whose duty it was to serve at the Lord's Supper, or agape, and to minister alms to the poor. It is generally believed that the institution of this office is recorded in Acts vi. 1–6, where, although the word *deacon* (διάκονος, minister) is not used of the seven persons appointed, the corresponding words "to minister or serve" (διακονεῖν) and "ministration" (διακονία) are employed. By an analogy with the Mosaic hierarchy, St. Clement of Rome in the apostolic age called the deacons *Levites*, and this use of the word Levite long remained frequent. (*b*) In the early Christian church, one of the third order of the ministry, of lower rank than bishops and presbyters. The deacons applied complete unction to men in preparation for baptism, but anointed women on the forehead only, assisted the celebrant at the eucharist, read the gospel and made proclamations during the liturgy, maintained order in the congregation, and cared for the poor and sick. Those attached to episcopal sees acted as the bishop's adjutants, messengers, and representatives, and when belonging to a great patriarchal or metropolitan see possessed much influence. Hence — (*c*) In the Greek Church, one of the third order of the ministry, similar in rank and duties to the officer of the same name in the early church. (*d*) In the Roman Catholic Church, a member of the third order of the ministry. He assists the priest throughout the celebration of the eucharist or mass, and reads the gospel. The principal assistant to the celebrant at a solemn celebration is called the *deacon*, and vested accordingly, whether in deacon's, priest's, or bishop's orders. (*e*) In the Anglican Church, a member of the third order of the ministry. His duties are to assist the priest in divine service, especially at the holy communion, help in distributing the elements to the people, read the Scriptures, especially the eucharistic gospel, catechize, baptize infants in the absence of the priest, preach if licensed by the bishop, and seek out the sick and poor and make their wants known to the curate. Deacons cannot consecrate the eucharist, pronounce absolution, or give benediction. The bishop, priest, or deacon who acts as principal assistant at the holy communion is called the *deacon* or *gospeler*. (*f*) In the Methodist Episcopal Church, a member of an order of the ministry next below that of elder. The deacons are elected by the annual conference, are ordained by the bishop, and are authorized to assist in the administration of the eucharist, to administer the rites of baptism and marriage, and to perform the duties of a traveling preacher. (*g*) In the Baptist and Congregational churches, one of two or more officers elected by each church to distribute the elements in the communion after they have been consecrated by the minister, and to act as the advisers of the pastor and as the almoners of the charities of the church. (*h*) In the Presbyterian Church, one of a number of officers elected by a congregation and ordained by the minister to assist the session in the care of the poor and in the general management of the secular affairs of the church. Deacons are not always appointed, their place being sometimes supplied by the elders. (*i*) In the Lutheran Church in the United States, one of a number of laymen chosen to attend to the charities and temporalities of a congregation. With an equal number of elders and the pastor, the deacons constitute the council of each church to manage its temporal and spiritual affairs. (*j*) In the Mormon Church, a subordinate official who acts as an assistant to the teacher, but has no authority to baptize or administer the sacrament. *Mormon Catechism*, xvii.

Before the passing of the Burgh Reform Act the deacons of the crafts or incorporated trades in royal burghs formed a constituent part of the town council, and were understood to represent the trades, as distinguished from the merchants and guild brethren. The deacon-convener of the trades in Edinburgh and Glasgow still continues to be a constituent member of the town council.

deacon (dē′kn), *v. t.* [< *deacon*, *n.*] 1. To make or ordain deacon. — 2. To read out, as a line of a psalm or hymn, before singing it: sometimes with *off*: from an ancient custom of reading the hymn one or two lines at a time, the congregation singing the lines as read. This office was frequently performed by a deacon. The custom is nearly as old as the Reformation, and was made necessary by the lack of hymn-books when congregational singing was introduced. One of an ecclesiastical order of women in the early church, who discharged for members of their own sex those parts of the diaconal office which could not conveniently or fitly be performed by men. They acted as doorkeepers and kept order on the women's side of the congregation, assisted at the baptism of women and administered the unction before baptism except the anointing of the forehead, instructed female catechumens, took charge of sick and poor women, and were present at interviews of the clergy with women. Such an order was especially needed in those Christian countries where Oriental seclusion of women prevailed. Deaconesses were required to remain unmarried, and were generally selected from the consecrated virgins or from the order of widows. In the Eastern Church the order continued into the middle ages, but it is not certain when it became extinct. In the Western Church it was abolished by successive decrees of councils during the fifth and succeeding centuries, and became finally extinct about the tenth. Abbesses were sometimes called deaconesses after the order became obsolete.

The word *deal*[2] is usually identified with *deal*[1], a part, with the accommodated definition "the division of a piece of timber made by sawing."] **1.** A board or plank. The name *deal* is applied chiefly to planks of pine or fir above 7 inches in width and of various lengths exceeding 6 feet. If 7 inches or less wide, they are called *battens*; and when under 6 feet long they are called *deal-ends*. The usual thickness is 3 inches, and width 9 inches. The standard size, to which other sizes may be reduced, is 2½ inches thick, 11 inches broad, and 12 feet long. A *whole deal* is a deal which is 1¼ inches thick; a *slit deal*, one of half that thickness. The word is little used in the United States.

I had little furniture, so I bought a cart-load of *deals*; took a carpenter . . . into my service; established him in a barn, and said, "Jack, furnish my house."
Sydney Smith, in Lady Holland, vii.

Civil officials so called were known to the Roman law, and are mentioned in the codes of Theodosius and Justinian. The title was thence adopted for Christian use. In the monasteries, for every ten monks a decanus or dean was nominated, who had the charge of their discipline. The senior dean, in the absence of the abbot and provost, governed the monastery; and, since monks had the charge of many cathedral churches, the office of dean was thus introduced into them. Custom gradually determined that there should be only one dean in a cathedral, and he eventually assumed the chief charge of its ecclesiastical and ritual concerns, especially in regard to the choir. He became also general assistant to the bishop. In the Roman Catholic Church, assistants of the bishop, termed *rural deans*, in France in former times often possessed, and in Germany in certain cases still possess, large powers of visitation, administration, and jurisdiction, so that their authority is almost equal to that of bishops. In the Church of England there are, besides the deans of the cathedrals, called *deans of chapters*, whose authority is next that of the bishop, *rural deans*, who are in effect assistants to the bishop, and whose duty it is to visit certain parishes in the diocese, and report on their condition to the bishop. Their functions at one time became almost obsolete, but they have been revived to some extent in recent times. The word is also applied in England to the chief officers of certain peculiar churches or chapels: as, the *dean of the king's chapel*. In the Episcopal Church in America the presiding presbyter of the semi-official body known as a convocation, and of the division of a diocese represented by this body, which division is also called a convocation and is in some respects analogous to the English rural deanery, is called a dean (the dean of convocation).

To save a bishop, may I name a *dean*?
Pope, Epil. to Satires, ii. 33.

2. In universities, originally, the head of a faculty (and most historical writers consider a

dean as essential to the existence of a faculty). The office was at first directly or indirectly elective for one or two years, while commonly filled by the eldest master regent. But the faculties, having in Great Britain and America lost their early more independent corporate existence, are now usually presided over by the head of the university, and the office of dean has sunk to that of a mere registrar or secretary, or has ceased to exist. In English colleges the dean presides in chapel, looks after the moral and religious welfare of the scholars, and is charged with the preservation of discipline. The office is commonly united with one of the tutorships. The office of dean of a college or school is evidently a mere adaptation of that of dean of a monastery, and as such dates from far earlier times than that of dean of a faculty, although the faculties long preceded the colleges.

Certain censors, or *deanes*, appointed to looke to the behaviour and manner of the Students there [at Cambridge]. *Holinshed*, Chronicles.

He long'd at college, only long'd,
All else was well, for she-society. . . .

Tennyson, Princess, Prol.

3. The oldest member in length of service of a constituted body, or a body of persons of equal rank, of whom he is the prescriptive leader in all joint action: as, the *dean* of the diplomatic corps; the *dean* of the French Academy; the *dean* of the Sacred College (the oldest of the cardinals, who possesses high authority by right of his seniority).—**4.** The president for the time being of an incorporation of barristers or law practitioners.—**Dean and chapter**, a bishop's council, consisting of the dean and his prebendaries, whose duties consist in aiding the bishop with their advice in affairs of religion and in the temporal concerns of his see.—**Dean of Arches**, the chief judicial officer of the Archbishop of Canterbury, dean of the Court of Arches, but not really a dean in the modern sense of the word.—**Dean of Faculty**, the president of the Faculty of Advocates in Scotland.—**Dean of gild.** (*a*) The chief officer of a medieval trade-gild, and of some existing gilds in Europe.

They represented that it had been customary to consult, after the city magistracies, only the captains of companies and the *deans of guilds* in matters of government. *Motley*, Dutch Republic, III. 20.

(*b*) In Scotland, the elected head of the merchant company or gildry of a royal burgh, who is a magistrate of the burgh for the supervision of all matters relating to the erection and character of buildings. The office in the full sense now exists only in Edinburgh, Glasgow, Aberdeen, and Perth, its duties in other burghs being performed by an officer bearing the same title, elected by the town council.—**Dean of gild court**, in Scotland, a court presided over by the dean of gild, the jurisdiction of which is confined to the regulation of buildings, to such matters of police as have any connection with buildings, and to the regulation of weights and measures.—**Dean of peculiars.** See *peculiar*.—**Dean of the chapel royal**, a title bestowed on six clergymen of the Church of Scotland, who receive from the crown a portion of the revenues which formerly belonged to the chapel royal in Scotland.—**Dean of the province of Canterbury**, the Bishop of London, to whom, when a convocation is to be assembled, the archbishop sends his mandate for summoning the bishops of the province.

Fiske*, Cosmic Philos., I. 176.

In this sense the form *decad* is exclusively used. The *decad* was considered significant as being the base of numeration and potentially embracing all numbers, and thus representing the cosmos or its source. It was further considered as highly significant that the *decad* is 1 + 2 + 3 + 4, for four naturally suggests organic perfection, since melodies and other compositions are best divided into four parts, and for other reasons; so that the greatness of Pythagoras as a philosopher was summed up in his title of "revealer of the quaternary number." By cabalists it is considered important as being the number of the commandments.

All numbers and all powers of numbers appeared to them [the Pythagoreans] to be comprehended in the *decad*, which is therefore called by Philolaus great, all-powerful, and all-producing, the beginning and the guide of the divine and heavenly, as of the terrestrial life.

Decimal arithmetic, the ordinary method of arithmetical calculation by the Arabic notation. The term is sometimes restricted to the calculation with decimals.—**Decimal currency.** See *currency.*—**Decimal fraction**, a fraction whose denominator is a power of 10. So long as the quantity is conceived as having a power of 10 for its denominator it is properly and usually called a decimal fraction, however it may be written. The ordinary method of writing it is by prefixing to the numerator (used alone) a dot (the decimal point) with a number of zeros sufficient to make the number of places in the numerator equal to that in the denominator, less one. Thus, $\frac{1}{10}$ = .1, $\frac{1}{100}$ = .01, $\frac{1}{1000}$ = .001, etc.; $2\frac{1}{100}$ = 2.06, etc. See II.—**Decimal measure**, any measure belonging to a decimal system.—**Decimal notation**, a system of writing numbers depending on powers of 10, especially the ordinary system by means of nine digits and a cipher. The system in an imperfect form, wanting the 0 (the places being preserved by ruled columns), is believed to have been invented in India, and is explained in the Latin geometry of Boëthius (died about A. D. 525). The genuineness both of the passage and of the entire work has been much disputed, but is now more usually conceded. The system was, however, entirely disused in Europe until (having been completed by the invention of the 0) it was reintroduced through the Arabians (by whom it is called the *Indian notation*), being first systematically explained in the work of Leonardo da Pisa, about 1200. The extension of the system to fractions was accomplished much later. See II.—**Decimal numeration**, any system of naming numbers by taking them in multiples and powers of 10. Such systems have generally prevailed in all languages, being founded on the use of the ten fingers as helps to count.—**Decimal place**, the position of a figure in decimal notation.—**Decimal point**, a dot separating the whole part from the fractional part of an expression in decimal notation. The decimal point appears to have been first used by Napier (*Constructio*, 1619); the writing of it above the line by Newton. See II.—**Decimal system**, any system of measurement or of counting whose units are powers of 10; especially, the metric system (which see, under *metric*).

II. *n.* An expression denoting a decimal fraction by an extension of the decimal notation. A dot, called the *decimal point*, being placed to the right of the units' place, figures are written to the right of it, the first place in passing to the right being appropriated to tenths, the second to hundredths, etc. Thus, 199320.3 is the same as $199320\frac{3}{10}$; 19932.03 is the same as $19932\frac{3}{100}$; and 1.993203 is the same as $1\frac{993203}{1000000}$. (See *decimal fraction*, above.) The invention of decimals is usually attributed to Stevinus (1582). In his notation a mixed number, for example $1993\frac{2}{100}$, which is now written 1993.02, would have been written 1993(0)2(1)0(2)8(3). The decimal point may be placed above the line (a common practice) or on the line.—**Recurring decimal**, a decimal in which after a certain point the digits are continually repeated. If there is but one recurring figure, the expression is called a *repeating decimal*; if there are more than one, the expression is called a *circulating decimal.* But these distinctions are not commonly observed with strictness. A circulating decimal is denoted by means of dots over the first and last figures of the recurring period. Thus, $\frac{1}{74}$ is 0.0135, that is, 0.0135135135, etc.

But these words are often used interchangeably.

2. An approximately horizontal platform or floor extending from side to side of a ship or of a part of a ship, as of a deck-house, and supported by beams and carlines. In wooden ships the deck is formed of planks about three inches wide and three inches thick, spiked to the beams and carlines; in iron ships it is formed of iron plating riveted to the beams and girders and generally covered with wooden planking. An armored deck is protected by iron or steel plating. The *spar-deck* is the upper deck of those which extend from stem to stern; the *main deck* is the deck immediately below the spar-deck in a double-decked ship; the *quarter-deck* is that part of the spar-deck which is abaft the mainmast; the *topgallant forecastle-deck* is a short deck above the spar-deck in the forward part of the ship, generally extending as far aft as the foremast. In a man-of-war the *berth-deck* is the deck below the gun-deck, where the mess-lockers and -tables are placed, and where the hammocks are slung. The *gun-deck* is the deck of a man-of-war where the battery is carried; in old line-of-battle ships, where guns were carried on three decks below the spar-deck, they were called respectively the upper, middle, and lower gun-deck. A *flush deck* is a spar-deck clear from stem to stern of houses or other encumbrances. The term *half-deck* was formerly applied to the after part of the deck next below the spar-deck, and forward of the cabin bulkhead. The *hurricane-deck* is the upper light deck of side-wheel passenger-steamers. The *orlop-deck* is below the berth-deck, and is where the cables were formerly stowed. The *poop-deck* is the after part of the ship, over the cabin, when the cabin is on the spar-deck. The *turtle-deck* or *turtle-backed deck* is so called from its resemblance to the back of a turtle, and is a convex deck extending a short distance aft from the stem of an ocean steamer to shed the water in a head sea; in many iron steamships of recent model there is a similar arrangement on the stern. In river-steamers in the United

States the *boiler-deck* is the deck on which the boilers are carried. A *cambered deck* is a deck arched so as to be higher in the middle than at the stem or stern — the opposite of the usual practice.

He must increase, but I must *decrease*. John iii. 30.

Decreasing series. See *progression.*—Syn. *Decrease, Diminish, Dwindle, Contract*; to lessen, abate, ebb, subside, fall off, fall away, shrink. The first three all mean a becoming less by degrees. *Decrease* more often implies that the causes are imperceptible or not necessarily perceptible, acting, it may be, from within the object itself: as, the swelling *decreases* daily. *Diminish* generally implies the action of some external cause which is more or less in the mind of those concerned: as, his fortune *diminishes* daily through extravagance; the troops *diminish* steadily under disease and conflict. *Decrease* is the appropriate word for reduction of bulk or volume, *diminish* for reduction of number. These distinctions are not always observed. To *dwindle* is to become small in size, amount, or number by slow and imperceptible degrees, the reduction being always undesirable and the result a sort of attenuation: as, the army *dwindled* to a few thousands; the child *dwindled* to a mere skeleton. To *contract* is to become less by shrinkage or a drawing together of parts or elements; it implies loss of size, bulk, or extent, without the loss of constituent substance or parts usually expressed by the other words.

So many wives, who have yet their husbands in their arms; so many parents, who have not the number of their children lessened; so many villages, towns, and cities, whose inhabitants are not *decreased*, their property violated, or their wealth *diminished*, are yet owing to the sober conduct and happy results of your advice.
Dryden, King Arthur, Ded.

If the activities of a living body involve an expenditure not made good by nutrition, *dwindling* follows.

5. In *theol.*, one of the eternal purposes of God, whereby for his own glory he has foreordained whatsoever comes to pass. Whether these decrees are absolute or conditional—that is, whether they are according to the counsel of his own will, "without any foresight of faith or good works, or any other thing in the creature, as conditions or causes moving him thereto" (*West. Conf. of Faith*, iii.), or are based upon his foreknowledge of the character and course of his free creatures—is a contested question, the Calvinists taking the former view, the Arminians the latter.

By the *decree* of God for the manifestation of his glory, some men and angels are predestinated unto everlasting life and others foreordained to everlasting death.
West. Conf. of Faith, iii. § 3.

=**Syn. 1.** *Decry, Depreciate, Detract from, Derogate from, Disparage*, run down, discredit. These words agree in expressing an effort to lower the esteem in which a person or thing is held. If the effort is unjust, the injustice is not so conspicuous as in the words compared under *asperse*. *Decry*, to cry down, clamor against, implies activity and publicity; it is hardly applicable to persons. *Depreciate*, primarily to lower the value of, is less forcible than *decry*, and may apply to persons. *Detract from* and *derogate from* have almost precisely the same meaning — to take from or diminish repute, as by caviling, ascribing success to accident, good conduct to low motives, etc. *Disparage*, to make a thing unequal to what it was in repute: underrate. The last four need not have a personal subject: as, it would *derogate* very much *from* his standing; it would *disparage* him in public estimation if it were known.

From a parcel of goods of known value or number articles are *subtracted* or literally taken away as required; the value or number of the remainder at any time may be ascertained by *deducting* the value or number of those taken from the original package; and this again is effected by *subtracting* the figures representing the smaller amount from those representing the larger.

3. In *logic*, derivation as a result from a known principle; necessary inference; also, the result itself, as so concluded. As a term of logic, it is a translation of Aristotle's ἀναγωγή (translated *deductio* by Boëthius), and properly signifies an illative descent from a general principle to the result of that principle in a special case; it is specially used by Aristotle when there is a doubt whether the case truly comes under the principle. By the older logicians it is little used, and not with any exact signification. In modern times it has been chiefly employed by those who hold that all reasoning is either a descent from generals to particulars (*deduction*) or an ascent from particulars to generals (*induction*). See *deductive reasoning*, under *deductive*.

Probation may be either a process of *deduction*—that is, the leading of proof out of one higher or more general proposition—or a process of induction—that is, the leading of proof out of a plurality of lower or less general judgments. *Sir W. Hamilton.*

Deduction . . . is the inverse process of inferring a particular case from a law of cases assumed to be of like nature. *G. H. Lewes*, Probs. of Life and Mind, 1st ser., III. iv. § 47.

We ought therefore to be fully aware of the modes and degree in which the forms of *deductive* reasoning are affected by the theory of probability, and many persons might be surprised at the results which must be admitted. *Jevons.*

Before *deductive* interpretation of the general truths, there must be some inductive establishment of them.
H. Spencer, Prin. of Sociol., § 211.

2. Deduced; derived as a conclusion from accepted principles; relating to inference from a principle to the results of that principle in any special case.

He labours to introduce a secondary and *deductive* Atheism: that although men concede there is a God, yet they should deny his providence.
Sir T. Browne, Vulg. Err., i. 10.

Deductive method, in the logical system of J. S. Mill, that mode of investigation by which the law of an effect is ascertained from the consideration of the laws of the different tendencies of which it is the joint result. This method consists of three kinds of operation, the first direct induction, the second ratiocination, the third verification.

To the *deductive method*, thus characterized in its three constituent parts of induction, ratiocination, and verification, the human mind is indebted for its most conspicuous triumphs in the investigation of nature.
Mill, Logic, III. xi. § 6.

Deductive reasoning is commonly opposed to *inductive*, and is meant to include all necessary reasoning (even mathematical induction), together with those probable reasonings which predict results as true in the long run, but excluding those inferences which are regarded as being open to correction in the long run. Thus, if, from counting the letters on a single page, one concludes the proportions of the different letters which will generally be needed in a font of type, the reasoning is *inductive*; but if, knowing what the proportions generally are, one concludes what will be needed in printing a particular book or page, the reasoning is *deductive*.

deductively (dē-duk′tiv-li), *adv.* By deduction; in consequence of a general principle.

Deep-sea lead-line, a line used for soundings from 20 to 200 fathoms, marked at every 5 fathoms and used with a lead ranging from 60 to 150 pounds in weight.—**Deep-sea sounding-machine**, the combination of mechanical contrivances by the aid of which soundings may be made to great depths, with a close approach to accuracy. This result has been attained by a combination of improvements, in which great ingenuity has been displayed, and in which the inventive genius of Sir William Thomson has been particularly conspicuous. The principal features of the most perfect sounding-machine are: (1) the sinker, which is a cannon-ball, through which passes a cylinder provided with a valve to collect and retain a specimen of the bottom, the cylinder being, by an ingenious mechanical arrangement, detached from the shot, which remains at the bottom; (2) the line, made of steel wire, weighing about 14½ pounds to the nautical mile; (3) machinery for regulating the lowering of the sinker and for reeling in the wire with the cylinder attached in such a manner that the irregular strain due to the motion of the ship may be guarded against and the danger of breakage thus reduced to a minimum. In the deepest accurate sounding yet made the bottom was reached at the depth of 4,655 fathoms, but owing to the breaking of the wire no specimen was obtained. This sounding was made on the "Tuscarora" by Commander G. E. Belknap, U. S. N., in north latitude 44° 55′, east longitude 152° 28′. The deepest sounding yet made in which a specimen of the bottom was brought up was that of the United States Coast Survey steamer "Blake," off Porto Rico, the depth there reached being 4,561 fathoms.

deer (dēr), *n. sing.* and *pl.* [Early mod. E. also *deere*, and often *dear*, *deare*; < ME. *der*, *deor*, < AS. *deór*, a wild animal, often in combination, *wild deór*, *wildeór*, *wilder* (whence ult. E. *wilderness*, q. v.), = OS. *dier* = OFries. *diar* = D. *dier* = LG. *deer*, *deert* = OHG. *tior*, MHG. *tier*, G. *tier*, *thier* = Icel. *dȳr* = Sw. *djur* = Dan. *dyr* = Goth. *dius*, a wild animal. Origin uncertain; perhaps orig. an adj., meaning 'wild,' identical with AS. *deór*, bold, brave, vehement, OHG. *tiorlih*, wild. (The AS. *deór*, bold, brave, vehement, was merged later with *deóre*, E. *dear*: see *dear*.) Not connected with Gr. θήρ, Æolic φήρ, a wild beast, or with L. *fērus*, wild, fem. *fēra* (sc. *bestia*), a wild beast (whence ult. E. *fierce*, *ferocious*). The restricted (but not exclusive) use of the word (for *Cervus*) appears in ME., Icel., Sw., Dan., and G. (in hunters' language), and now prevails in mod. E. It is due to the importance of this animal in the chase. Similarly, in Iceland, *dȳr* is applied esp. to the fox, as the only beast of prey. In some parts of the United States the horse, as the most important of a general class, is called simply *beast* or *critter* (*creature*); 'a critter company' is a cavalry company (Prov., U. The largest living deer are the elk of Europe and the moose of America; the smallest are the muntjacs and musk-deer, which are further distinguished by the large tusk-like canine teeth of the males. The term *deer* being so comprehensive, and the animals being so conspicuous, the leading kinds have mostly received distinctive names, as the reindeer, roe-deer, musk-deer, etc. (See these words, and also *brocket*, *elk*, *moose*, *roe*, *stag*, *wapiti*, *caribou*, *blacktail*.) Deer are found fossil as far back as the Pliocene period. The best-known extinct species is the Irish elk, *Cervus megaceros*. The leading genera of living deer are *Alces*, *Rangifer*, *Dama*, *Cervus* (with many subgenera), *Capreolus*, *Cervulus*, *Moschus*, and *Hydropotes*. The species are numerous, and are found in most continental parts of the world, excepting southern Africa and Australia. The common deer of the United States is *Cariacus virginianus*. =Syn. 5. *Beat, Overpower, Overwhelm, Defeat, Discomfit, Rout, Overthrow*, conquer. *Beat* is a general, somewhat indefinite, but vigorous word, covering the others. *Overpower* and *overwhelm* are the least discreditable to the one that loses in the struggle; *overpower* is least permanent in its effects. To *overpower* is to overcome by superiority of strength or numbers, but the disadvantage may be changed by the arrival of reinforcements. To *overwhelm* is to bear down utterly, to sweep clear away by superior strength. *Defeat* is to overcome or get the better of in some kind of contest, and implies less discredit, but generally greater disaster, to the defeated party than *beat*: as, that army is considered *beaten* which withdraws from the field. *Defeat* implies a serious disadvantage, because it applies more often to large numbers engaged. *Discomfit* has fallen into comparative disuse, except in its secondary sense of foiling, etc.; in that it expresses a comparatively complete and mortifying defeat. *Rout* is to defeat and drive off the field in confusion. *Overthrow* is the most decisive and final of these words; it naturally applies only to great persons, concerns, armies, etc. See *conquer*.

There's a lean fellow *beats* all conquerors.

O. W. Holmes, Old Vol. of Life, p. 255.

Of course, every one who is in the habit of using a telescope in the daytime is familiar with the fact, that on many seemingly cloudless days there is an otherwise invisible kind of haze, which impairs or destroys *definition*, and that the best or brightest vision is obtained in the blue sky visible between large, floating annuli. *Science*, IV. 94.

2. The act of stating the signification of a word or phrase, or the essential properties of a thing.

Definition is so closely connected with classification that, until the nature of the latter process is in some measure understood, the former cannot be discussed to much purpose. *J. S. Mill*, Logic, I. viii. § 1.

Enthusiastically attached to the name of liberty, these historians troubled themselves little about its *definition*.
Macaulay, History.

3. A statement of the signification of a word or phrase, or of what is essential to the conception of any given thing; an explanation of how any given kind is distinguished from all other kinds. Three conceptions of the nature of definition have prevailed at different times: (1) Aristotle taught that every strict definition consists of two parts, different in kind, one declaring the genus or higher class to which the species defined belongs, the other declaring the specific difference by which the given species differs from others of the same genus. This view influences most of the definitions of systematic botany and zoology. (2) The theory of logical extension and comprehension, coming into vogue on the overthrow of Aristotelianism and attaining its extreme development in the formal logic of Kant and his followers, made the definition a mere list of essential marks all standing upon one footing and aggregated together without any distinction between genus and difference. This, being an extremely nominalistic view, answers very well for the definitions of some artificial classes in mathematics, etc. (3) Modern logicians, recognizing that the elements of a definition are neither, in general, merely joined together without order nor always combined on one fixed model, conceive the definition to be an explanation of the construction of the concept to be defined out of others better known. According to the two first views alike, some concepts are indefinable because so abstract that no wider ones embracing them can be found; according to the third, no concept can be too abstract to admit of definition, the only indefinable ideas being such as the sensation of redness, the sense of fear, and the like, which direct experience alone can impart. An example of definitions conforming to the third conception is: "An *uncle* is the son of a parent of a parent"—a definition in which the notions of *son* and *parent* neither stand in the relation of genus and difference nor are merely aggregated together. Such also is the definition "*Substance* is the permanent element in the phenomenon."

Though *definitions* will serve to explain the names of substances as they stand for our ideas, yet they leave them not without great imperfection as they stand for things.
Locke, Human Understanding, III. xi. 24.

Abundant definition, a definition which specifies characters which might be omitted without widening the class of things to which the definition applies.—**Accidental definition,** a description.—**Adequate definition** or **mark,** a definition which applies to every individual of the class defined, and to no other.—**Analytical definition,** a definition expressing an analysis of a notion already formed, and embodied in a word or phrase already in use.—**Causal definition.** See *causal*.—**Circle in definition.** See *circle*.—**Conceptual definition,** the analysis of a concept; the exact setting forth of the contents of a notion.—**Descriptive definition,** a definition which designates the thing defined by means of inessential attributes.—**Essential definition,** a strict definition stating the true constitutive essence of the definitum.—**Nominal definition,** an explanation of the meaning of a word.—**Real definition,** the statement of the design or idea of a real kind. Thus, any artificial object, as a sewing-machine, is defined by stating the purpose and the nature of the contrivance by which the purpose is intended to be attained. The real definition of a natural species supposes the species to owe its being to some intelligible idea which the definition attempts to state.—**Synthetical definition,** a definition expressing the mode of constructing a new conception; a definition for a new term therein proposed, or for a new sense proposed for an old word.

definitional (def-i-nish'ọn-al), *a.* [< *definition* + *-al.*] **1.** Of or pertaining to definition; used in defining.

E. R. Lankester, Degeneration, p. 30.

And now to inquire briefly what is meant by *degeneration*. It means literally an unkinding, the undoing of a kind, and in this sense was first used to express the change of kind without regard to whether the change was to perfect or to degrade; but it is now used exclusively to denote a change from a higher to a lower kind: that is to say, from a more complex to a less complex organisation; it is a process of dissolution, the opposite of that process of involution which is pre-essential to evolution.

By the *simple* or *verbal degradation* the accused is deprived of all his orders and benefices. By the *solemn* or *real degradation* he is with great ceremony stripped of his ecclesiastical vestments and ornaments and publicly reproached by the bishop, deprived of his orders and benefices as in simple degradation, and of his various privileges. 5. In universities and colleges, an academical rank conferred by a diploma, originally giving the right to teach. The earliest degree was that of *master*, which in the university of Bologna, and others modeled on that (as were the faculties of law in all the old universities), was called the degree of *doctor*. Afterward the lower degree of *determinant* (later called *bachelor*) was introduced, and the intermediate degree of *licentiate*; but these were not regular degrees, except in the faculty of arts. The degree of bachelor was conferred by the "nation" of the faculty of arts; the others were given by the chancellor, by authority of the pope. Thus, the medieval degrees were: (1) the degree of determinant, or bachelor of arts, without a diploma; (2) the license; (3) the degree of master of arts; (4) the degree of master or doctor of theology; (5) the degree of master or doctor of medicine; (6) the degree of doctor of laws. The degrees now usually conferred are bachelor, master, and doctor: as, bachelor of arts, divinity, music, or law; master of arts; doctor of divinity, law, medicine, philosophy, music, etc.

6. In *geneal.*, a certain distance or remove in the line of descent, determining the proximity of blood: as, a relation in the third or fourth *degree*. See first extract, and *forbidden degrees*, below.

In the canon law, *degree* of relationship is reckoned by the number of steps from the person farthest from the common ancestor to him; in the civil law, by the number of steps from one person up to the common ancestor and down to the other. Thus, a grand-uncle is related to his grand-nephew in the third *degree* by the canon law, in the fourth *degree* by the civil. *Stimson.*

She was as familiar as a cousin; but as a distant one—a cousin who had been brought up to observe *degrees*.
H. James, Jr., Harper's Mag., LXXVI. 342.

7. In *alg.*, the rank of an equation, as determined by the highest power under which an unknown quantity appears in it. Thus, if the exponent of the highest power of the unknown quantity be 3 or 4, the equation is of the third or fourth *degree*.

8. One of a number of subdivisions of something extended in space or time. Specifically—(*a*) One of a number of equal subdivisions on the scale of a meteorological or other instrument, as a thermometer. (*b*) A unit for measuring circular arcs and the angles subtended by them at their centers, being the 360th part of a circumference, or the 90th part of a right angle. Considered as angular magnitudes, all degrees are equal; considered as lengths of arcs, they are directly proportional to the radii of the circles of which they are parts. This manner of dividing the circle originated with the Babylonians about 2000 B. C., and was brought into use in Greece by the mathematician Hypsicles. It was perhaps in its origin connected with an opinion that the year consisted of 360 days. The common abbreviation or sign for "degrees" is a small circle (°) placed to the right of the top of the last figure of the number of them: as, 45°. The degree is subdivided into 60 minutes, and the minute into 60 seconds. The length of a degree of latitude is the length of an arc of the section of the figure of the sea-level by a meridian, the difference of latitude between the extremities of this arc being one degree. (See *latitude*.) It is 68.702 statute miles at the equator, and 69.396 at the poles. The length of a degree of longitude is the length of an arc of the section of the figure of the sea-level by a plane parallel to the equator, the difference of longitude between the extremities of this arc being one degree. This is nearly proportional to the cosine of the latitude, and is equal to 69.16 statute miles at the equator.

(*c*) In *arith.*, three figures taken together in numeration: thus, the number 270,360 consists of two *degrees* (more commonly called *periods*). (*d*) In *music*: (1) One of the lines or spaces of the staff, upon which notes are placed. Notes on the same degree, when affected by accidentals, may denote different tones, as D, D♯, and D♭; and, similarly, notes on different degrees, as D♭ and C♯, may denote identical tones, at least upon instruments of fixed intonation. (2) The difference or step between a line and the adjacent space on the staff (or vice versa). Occasionally, through the use of accidentals, this difference is only apparent (see above). (3) The difference, interval, or step between any tone of the scale and the tone next above or below it, as from *do* to *re*, from *mi* to *fa*. The interval may be a whole step or tone, a half step or semitone, or (in the minor scale) a step and a half, or augmented tone. See *step*, *tone*, *interval*, *staff*, *scale*. [To distinguish between degrees of the staff and degrees of the scale, the terms *staff-degree* and *scale-degree* are sometimes used.]

10. In *criminal law*: (*a*) One of certain distinctions in the culpability of the different participants in a crime. The actual perpetrator is said to be a principal in the *first degree*, and one who is present aiding and abetting, a principal in the *second degree*. (*b*) One of the phases of the same kind of crime, differing in gravity and in punishment. [U. S.]—**Accumulation of degrees.** See *accumulation*.—**By degrees**, step by step; gradually; by little and little; by moderate advances.

Chronic degree, one 360th part of a tropical year.—**Conjunct degrees.** See *conjunct.*—**Degree cut.** See *cut.*—**Degree of a curve**, the same as its *order*, but the latter term is preferable.—**Degree of constraint.** See *constraint.*—**Degree of freedom.** See *freedom.*—**Discrete degrees.** See *discrete.*—**Forbidden** or **prohibited degrees**, in *civil* and in *canon law*, degrees of consanguinity and affinity within which marriage is not allowed. The determination of these in church or canon law was founded on the prohibitions contained in Lev. xviii., with adherence to the principle that a degree of relationship which bars marriage in one sex bars it equally in the other, and that by Christ's declaration (Mat. xix. 6 and Mark x. 8, confirming Gen. ii. 24) a man and his wife become one flesh. The Roman law prohibited nearly the same degrees, though marriage of a man with his niece was permitted from the time of Claudius until forbidden by Nerva, and also from the time of Caracalla to that of Constantine. Marriages with a deceased brother's wife and a deceased wife's sister were forbidden by Constantius. Theodosius the Great forbade them between first cousins, and this was the general rule of the church from that time on. From the sixth to the thirteenth century, marriages within the seventh degree were prohibited; after the fourth Lateran Council (A. D. 1215), only those within the fourth degree. Marriage between godparents and godchildren was prohibited by Justinian, and this was afterward extended to include the parents of the children, and later still other relations of these. The presenter for confirmation was put on a par with the godparents. The Council of Trent limited such spiritual relationship to sponsors, to presenters at confirmation, to the persons baptized or confirmed, and the parents of these. In England marriage between first cousins was forbidden till the Reformation. The present English law of both church and state is conformed to a statute passed under Henry VIII., and revised under Elizabeth, which forbids all marriages not without the Levitical degrees. These degrees were tabulated by Archbishop Parker in 1563, and his table is adopted in the 99th canon of 1603, and ordered to be set up publicly in every church. It will also be found printed at the end of every English prayer-book. Its provisions have been summarized as follows: A man may not marry the mother or stepmother of his own or his wife's parents; the widow of his father, father-in-law, uncle, brother, son, stepson, or nephew; the aunt, sister, daughter, or niece of himself or his wife; the daughter or stepdaughter of his own or his wife's children. A woman may not marry the father or stepfather of her own or her husband's parents; the widower of her mother, mother-in-law, aunt, sister, daughter, stepdaughter, or niece; the uncle, brother, son, or nephew of herself or her husband; the son or stepson of her own or her husband's children. Marriage with a deceased wife's sister, whether expressly forbidden by the Mosaic law or not, is prohibited as precisely analogous to that with a deceased husband's brother, the marriage of a man with his brother's wife being explicitly prohibited in Lev. xviii. Direct relationship, if in the ascending and descending line, is canonically reckoned as one degree, and marriage prohibited accordingly. In canon law an illicit connection is held to involve the same prohibitions as a marriage.—**In degree†**, greatly; to a degree.

Delphinus (del-fī'nus), *n.* [L., a dolphin: see *delphin*[1] and *dolphin*.] 1. The typical genus of the family *Delphinidæ*, to which very different limits have been assigned. (*a*) By the authors of the Linnean school it was used for all the cetaceans with teeth in both jaws, and consequently for the *Delphinidæ* (except *Monodon*), *Platanistidæ*, and *Iniidæ*. (*b*) By later authors it was restricted to *Delphinidæ*, but included at first all except those of the genera *Phocæna* and *Delphinapterus*; gradually others were excluded. (*c*) By recent authors it is restricted to species of *Delphininæ* whose chief peculiarity is in the deep longitudinal grooves on the sides of the palate, separating the alveolar border from the median ridge. They have numerous (more than 80) small pointed teeth, close set along each jaw; from 50 to 90 vertebræ; the rostral part of the skull longer than the cranial portion, whence the head has a pointed snout marked off from the forehead by a groove; the dorsal fin large, triangular or falcate, sometimes wanting; and the flippers of moderate size, narrow, pointed, and falcate, with the lateral digits small or rudimentary. As thus defined, the genus contains the animals to which the word *dolphin* should be restricted, as the original dolphin of the ancients, *Delphinus delphis*, but which are commonly called *porpoises* by confounding them with the species of *Phocæna*, sometimes called *bottle-nosed* or *bay porpoises*. The tursio, *D. tursio*, is a larger and bulkier species. Sundry dolphins marked with white, and having from 80 to 90 vertebræ, constitute a group to which the name *Lagenorhynchus* is applied. A Chinese species, with only about 50 vertebræ, is called *Steno sinensis*. A species from the south seas, *D. peroni*, without a dorsal fin, has been called *Leucorhamphus* and *Delphinapterus*. See cut under *dolphin*.

It resembles Aich metal and sterro-metal (see these words), the principal difference being that in the manufacture of delta-metal improvements have been made by means of which a fixed percentage of iron can be introduced, which was not the case with the other alloys mentioned, whence these never came into general use. Delta-metal is said to be as strong as mild steel, and to have the great advantage of not rusting. A small steamer has been constructed of this alloy for navigating the rivers of Central Africa. It is said, also, that it has been introduced as a material for rolls in powder-mills because not liable to give rise to sparks as steel rollers do, and that it is coming into use for many other purposes where strength is desired, and where the facility with which steel rusts makes its employment undesirable.

E. A. Freeman, Amer. Lects., p. 383.

=Syn. 2. *Illusion, Delusion, Hallucination.* As now technically used, especially by the best authorities in medical jurisprudence, *illusion* signifies a false mental appearance or conception produced by an external cause acting through the senses, the falsity of which is capable of detection by the subject of it by examination or reasoning. Thus, a mirage, or the momentary belief that a reflection in a mirror is a real object, is an *illusion*. A *delusion* is a fixed false mental conception, occasioned by an external object acting upon the senses, but not capable of correction or removal by examination or reasoning. Thus, a fixed belief that an inanimate object is a living person, that all one's friends are conspiring against one, that all food offered is poisoned, and the like, are *delusions*. A *hallucination* is a false conception occasioned by internal condition without external cause or aid of the senses, such as imagining that one hears an external voice when there is no sound to suggest such an idea. If a person walking at twilight, seeing a post, should believe it to be a spy pursuing him, and should imagine he saw it move, this would be an *illusion;* a continuous belief that every person one sees is a spy pursuing one, if such as cannot be removed by evidence, is a *delusion;* a belief that one sees such spies pursuing, when there is no object in sight capable of suggesting such a thought, is a *hallucination*. *Illusions* are not necessarily indications of insanity; *delusions* and *hallucinations*, if fixed, are. In literary and popular use an *illusion* is an unreal appearance presented in any way to the bodily or the mental vision; it is often pleasing, harmless, or even useful. The word *delusion* expresses strongly the mental condition of the person who puts too great faith in an illusion or any other error: he "labors under a *delusion*." A *delusion* is a mental error or deception, and may have regard to things actually existing, as well as to illusions. *Delusions* are ordinarily repulsive and discreditable, and may even be mischievous. We speak of the *illusions* of fancy, hope, youth, and the like, but of the *delusions* of a fanatic or a lunatic. A *hallucination* is the product of an imagination disordered, perhaps beyond the bounds of sanity; a flighty or crazy notion or belief, generally of some degree of permanence; a special aberration of belief as to some specific point: the central suggestion in the word is that of the groundlessness of the belief or opinion.

Poetry produces an *illusion* on the eye of the mind, as a magic lantern produces an *illusion* on the eye of the body. *Macaulay*, Milton.

4. A public exhibition, by a number of persons, of sympathy with some political or other cause, as in a mass-meeting or a procession.—**5.** Proof, either (*a*) a process of stating in an orderly manner indubitable propositions which evidently cannot be true without the truth of the conclusion so proved, or (*b*) the propositions so stated. Properly, demonstration is restricted to perfect proof, especially mathematical proof. (See the extract from Burgersdicius, below.) According to the Aristotelian doctrine, which has greatly influenced the use of the word, *demonstration* must be drawn from principles not only self-evident, but also underived from any higher principles; and the conclusion must not only be shown to be true, but also to be a mere special case of the truth of one or more of the principles from which it is derived. It was supposed that this was the character of the best mathematical proofs; but mathematical proof consists in constructing a diagram or formula according to certain rules which prescribe that certain relations shall exist between the parts of that diagram, and then in showing by observation (directly or indirectly) that certain additional relations exist between those parts; and no important mathematical proof is of the nature of the Aristotelian demonstration. The word has consequently acquired two significations: first, its original sense of a perfect mathematical proof; second, the sense of a proof drawn from principles, as in the Aristotelian theory. There is also a third signification, according to which a *demonstration* is any proof which leaves no room for reasonable doubt, such as Kepler's proof that the orbit of Mars is an ellipse. Writers who adopt the Aristotelian view hold that the *reductio ad absurdum* and the Fermatian mode of proof, though entirely convincing, are not perfect demonstrations.

Some an admirable delight drew to Musicke; and some, the certainty of *demonstration* to the Mathematickes. *Sir P. Sidney*, Apol. for Poetrie.

Demonstration is a syllogism made of such propositions as are true, first immediate, and manifestly known, and be the causes of the conclusion. First and immediate here is all one, signifying such propositions as need not be proved or made more evident by any other former propositions. *Blunderville.*

Demonstration, in the Greek ἀποδείξις, is amongst the geometricians a delineation of a diagram, in which they exhibit the truth of their propositions to be seen by the eye. To that is opposed pseudographema: that is, a description or false delineation. Now these words, as many others, which are used in the doctrine of syllogism, are translated from geometry into logic; and there *demonstration* is taken sometimes for any certain and perspicuous proof, but here in this place strictly for syllogism scientific, and pseudographema, or false syllogism, for syllogism begetting error or contrary to science. *Burgersdicius*, tr. by a Gentleman.

densimeter (den-sim'e-tėr), *n.* [= Sp. *densimetro*, < L. *densus*, dense, + *metrum*, a measure.] An apparatus for ascertaining the specific gravity or comparative density of a solid or liquid, as metals, gunpowder, or sea-water. That used for testing the density of gunpowder consists essentially of a vessel in which the gunpowder is weighed in connection with mercury. The vessel is first partially filled with mercury by creating a vacuum; it is then emptied and a known weight of powder is placed in it, and the mercury again added under the influence of the same vacuum, less being admitted, however, in consequence of the space occupied by the powder. A comparison of the amount of mercury admitted with the weight of the powder gives the specific gravity of the powder. The *optical densimeter* of Hilgard consists of a glass prism for holding salt water, and a collimating telescope for examining a ray of light passing through the water in the prism, the refraction of the light giving the density of the water by comparison with the known angle of refraction of distilled water or sea-water of a known density. *Huch's densimeter* is used for ascertaining the density of syrups while boiling. See *salinometer*.

The *density* of the ether is greater in liquids and solids than in gases, and greater in gases than in vacuo.
Tyndall, Light and Elect., p. 62.

2. The mass or amount of matter per unit of bulk. The mass is the ratio of the living force or double the energy of motion to the square of the velocity. Experiments made by Newton upon the effect of attaching masses of different materials to pendulums have shown that the weights of bodies are precisely proportionate to their masses; consequently, the density is measured by the specific gravity, or the weight of a unit bulk. The unit of density is generally taken as that of water at its temperature of maximum density (4° C., 39° F.) and under ordinary pressure. Inasmuch as the gram was intended

to be, and within the limits of the probable error of the best observations actually is, the mass of one cubic centimeter of water under these conditions, it follows that the density as ordinarily expressed is, as closely as possible, the number of grams in one cubic centimeter of the particular kind of matter in question. The following table shows the density of several important substances: iridium, 22.4; platinum, 21.4; gold, 19.3; liquid mercury, 13.6; lead, 11.3; silver, 10.5; copper, 8.9; nickel, 8.7; iron, 7.8; tin, 7.3; zinc, 7.2; the earth, 5.6; solution of iodides of mercury and potassium, 3.2; diamond, 3.5; rock, about 2.7; aluminium, 2.6; sulphur, 2.0; magnesium, 1.7; the human body, 1.1; india-rubber, 1.0; alcohol, 0.8; ether, 0.7; lithium, 0.6; vapor of iodide of arsenic, 1.02; air, 0.0013; aqueous vapor, 0.0008; hydrogen, 0.00009. The electric *density* at a given point on a surface is the limiting ratio of the quantity of electricity within a sphere whose centre is the given point to the area of the surface contained within the sphere, when its radius is diminished without limit.
Clerk Maxwell, Elect. and Mag., § 64.

Gravimetric density of gunpowder, the weight of a measured quantity of gunpowder. It is expressed by the weight, in ounces, of a cubic foot of the powder.—**Magnetic density**, the rate of distribution of lines of force in a magnetic field. The unit is the gauss or one c. g. s. line per square centimeter.

dent[2] (dent), *n.* [< F. *dent*, OF. *dent* = Sp. *diente* = Pg. It. *dente*, < L. *den(t-)s* = Goth. *tunthus* = AS. *tōth*, E. *tooth*: see *tooth*, and cf. *dental*, *dentist*, etc. This word in E. is in part confused with *dent*[1], *n.*] **1†.** A notch; an indentation.

2. A tooth of a comb, metallic brush, or card. —**3.** A salient tooth or knob in the works of a lock. *E. H. Knight.*—**4.** A tooth of a gear-wheel. *E. H. Knight.*—**5.** A cane or wire of the reed frame in a weavers' loom.

dent[2]† (dent), *v. t.* [< ME. *denten*, by apheresis for *indenten*, < OF. *endenter*, < ML. *indentare*, tooth, notch, indent: see *indent*[2] and *dent*[2], *n.* This word is in part confused with *dent*[1], *v.*] To notch; indent.

Dentyn or yndentyn, [L.] *indento*.

dentagra (den-tag'rạ̈), *n.* [< L. *den(t-)s*, = E. *tooth*, + Gr. ἄγρα, a hunting, catching, taken in the senses it has in ποδάγρα, a trap for the feet, also gout in the feet (> E. *podagra*), χειράγρα, gout in the hands (> E. *chiragra*).] **1.** The toothache.—**2.** An instrument for drawing teeth; a tooth-forceps.

dental (den'tal), *a.* and *n.* [= F. *dental* = Sp. Pg. *dental* = It. *dentale*, < NL. *dentalis*, pertaining to the teeth (L. only in neut., *dentale*, n., the share-beam of a plow), < L. *den(t-)s* = E. *tooth*: see *dent*[2] and *tooth*.] **I.** *a.* **1.** Of or pertaining to the teeth.—**2.** In *gram.*, formed or pronounced at or near the front upper teeth, with the tip or front of the tongue: as, *d*, *t*, and *n* are *dental* letters. The name *dental* is very imperfectly descriptive, as the teeth bear no important part in producing the sounds in question, and even, in the utterance of many communities, no part at all. Hence some phonetists avoid the term, using instead *lingual*, *tongue-point*, or the like.

The Hebrews have assigned which letters are labial, which *dental*, and which guttural. *Bacon.*

3. Connected with or used in dentistry: as, *dental* rubber; a *dental* mallet or hammer.—**Dental arch**, the curved line of the teeth in their sockets, corresponding to the alveolar border of each jaw. The somewhat parabolic curve of this arch in man, and its continuity, are among the diagnostic zoological characters of the genus *Homo*.—**Dental canal.** See *canal*[1].—**Dental cartilage.** See *cartilage*.—**Dental cavity**, the natural hollow of a tooth; the pulp-cavity (which see).—**Dental chisel, cut, drill, file, foramen**, etc. See the nouns.—**Dental formula**, a formal or tabular statement of the number and kinds of teeth a mammal may have; a formula of the dentition, in which the letters *i.*, *c.*, *pm.*, and *m.* respectively denote *incisor*, *canine*, *premolar*, and *molar*, and figures are used to indicate the number of each kind of teeth, the figures above a horizontal line (like the numerator of a fraction) referring to the upper jaw, those below the line to the lower jaw. When the letter *d* is prefixed to *i.*, *c.*, *pm.*, and *m.*, it signifies *deciduous*, and consequently the formula is that of the milk-dentition. The dental formula is usually written in full, as in the subjoined extract; but since there are always the same number of teeth on each side of either jaw, sometimes only each half jaw is indicated: thus, the formula for adult man would be: i. $\frac{2}{2}$, c. $\frac{1}{1}$, pm. $\frac{2}{2}$, m. $\frac{3}{3} \times 2 = 32$. See the extract.

The *dental formula* of a child over two years of age is thus:

$$di.\ \frac{2-2}{2-2'},\ dc.\ \frac{1-1}{1-1'},\ dm.\ \frac{2-2}{2-2} = 20;$$

which means that the child should have two incisors, one canine, and two molars, on each side of each jaw. . . . The formula of the permanent dentition in man is written:

$$i.\ \frac{2-2}{2-2'},\ c.\ \frac{1-1}{1-1'},\ pm.\ \frac{2-2}{2-2'},\ m.\ \frac{3-3}{3-3} = 32;$$

there being two incisors, one canine, two premolars, and three molars on each side above and below.
Huxley, Anat. Vert., p. 80.

Dental hammer. See *hammer*.—**Dental letter.** See II., 1.—**Dental mallet.** See *mallet*.—**Dental pulp.** (*a*) The soft, sensitive, nervous and vascular substance which fills the cavity of a mature tooth. (*b*) The tissue or structure out of which a tooth is formed, and from which, as in the case of rodents, it may continue to grow for an indefinite period, in which case the teeth are said to have *persistent pulps*.—**Dental sac**, a closed dental follicle. See the extract.

The teeth are moulded upon papillæ of the mucous membrane, which may be exposed, but are more usually sunk in a fold or pit, the roof of which may close in so as to form a *dental sac*. *Huxley*, Anat. Vert., p. 80.

II. *n.* **1.** A sound formed by placing the end of the tongue against or near the upper teeth, as *d*, *t*, and *n* (see I., 2).—**2.** In *conch.*, a tooth-shell; a shell of the family *Dentaliidæ*.

Dentaliidæ (den-ta-lī'i-dē), *n. pl.* [NL., < *Dentalium* + *-idæ*.] A family of mollusks, constituting the class *Scaphopoda* (or order *Cirribranchiata* of *Gastropoda*); the tooth-shells. They are diœcious, headless, eyeless, with a trilobate foot, rudimentary lateral jaws, the mouth surrounded with filiform tentacles; the shell slender, conical, curved, open at both ends, with circular aperture and posterior attachment of the animal; the mantle saccular, open at both ends, the foot being protruded through the larger opening. The larvæ are free-swimming and ciliate, with a somewhat bivalvular shell, which subsequently becomes tubular. There are about 50 living and upward of 100 extinct species, the latter mostly Devonian. The animals live buried in the mud, where they crawl slowly about. (See *Scaphopoda*, *tooth-shell*.) The family has been divided by recent systematists into various genera, for which the names *Dentalium*, *Antale*, and *Entalis* have been used. Also *Dentalidæ*, *Dentaliadæ*.

By the older conchologists it was used for all the *Dentaliidæ*, or forms with tusk-like shells; but more recently it has been restricted to *Dentaliidæ* with the posterior end of the tusk-like shell furnished with an internal slightly projecting tube provided with a dorsoventrally elongated opening.

Dentaria (den-tā'ri-ạ̈), *n.* [NL., fem. of LL. *dentarius*, pertaining to the teeth: see *dentary*.] A genus of cruciferous plants, natives of the cooler portion of the north temperate zone. It is nearly allied to *Cardamine*, with which it is united by some authorities, differing mainly in its few opposite or subverticillate cauline leaves, and in its scaly creeping or tuberous rootstocks. From its toothed pungent roots it derives the names of coral-root, toothwort, pepper-root, etc. The flowers are large, white or light-purple.

II. *n.*; pl. *dentaries* (-riz). The distal or symphyseal piece or element of the compound lower jaw of vertebrates below mammals: so called because it bears or may bear teeth. It commonly forms most of the lower jaw as visible from the outside. In birds without teeth it forms about that part of the under mandible which is sheathed in horn. The dentary, as a rule, effects symphysis or unites with its fellow of the opposite side at its distal end; at its proximal end it is articulated or ankylosed with other bones, forming the proximal part of each half of the lower jaw. See cuts under *Cyclodus*, *Gallinæ*, and *temporomastoid*.

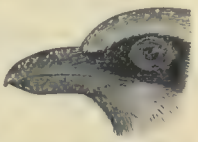
dentin, dentine (den'tin), *n.* [= F. *dentine* (= It. *dentina*), < L. *den(t-)s*, = E. *tooth*, + *-in*[2], *-ine*[2].] The proper substance or tissue of teeth, as ivory, for instance, as distinguished from enamel, cement, or pulp. Dentin resembles bone, but is ordinarily denser and harder. The difference is seen on microscopic section, when a multitude of very fine closeset tubules or canaliculi (the dentinal tubes) are seen following a parallel straight or wavy course, and no corpuscles or lacunæ appear, while bone-tissue shows abundant corpuscles with the canaliculi radiating in every direction. The corpusculated parts of teeth are the softer constituents, as the cement or pulp, for example, whence the canaliculi alone penetrate the dentin, which is therefore comparable to the canalicular substance of bone in a state of extreme density and hardness. See cut under *tooth*.



dentinal (den'ti-nal), *a.* [< *dentin* + *-al*.] Of or pertaining to dentin.—**Dentinal tubes**, the minute tubes of the dentin or ivory tissue of the tooth. See *dentin*.

The notch, nick, or tooth of the bill of the *Dentirostres* is not to be confounded with the tooth of the bill of certain birds of prey, as falcons, nor with the series of teeth of the lamellirostral birds, as ducks. In very many technically dentirostral birds there is no trace whatever of a notch or tooth.

Dentirostral Bill (Shrike).

dentirostrate (den-ti-ros'trāt), *a.* [< L. *den(t-)s*, = E. *tooth*, + *rostratus*, beaked, < *rostrum*, a beak: see *rostrum*.] Same as *dentirostral*.

Dentirostres (den-ti-ros'trēz), *n. pl.* [NL., pl. of *dentirostris*, toothed-billed: see *dentirostral*.] 1. In Cuvier's system of classification, the first family of his *Passerinæ*, "wherein the upper mandible is notched on each side towards the point. It is in this family that the greatest number of insectivorous birds occur, though many of them feed likewise upon berries and other soft fruits." They are contrasted with *Fissirostres*, *Conirostres*, and *Tenuirostres*. The immense assemblage of birds here indicated is definable by no common character, least of all by the one assigned by Cuvier, and the term consequently fell into disuse. It is still employed, however, in a modified sense, for a superfamily group of oscine passerine birds approximately equivalent to the turdoid *Passeres* of Wallace. See *Passeres*, *Turdiformes*.

2. In Sundevall's system of classification, a phalanx of the cohort *Cichlomorphæ*: synonymous with *Laniiformes*, as the name of a superfamily group embracing the shrikes and their immediate relatives.—3. dentistic, dentistical (den-tis'tik, -ti-kal), *a.* [< *dentist* + *-ic*, *-ical*.] Relating to dentistry or dentists.

Even the crocodile likes to have his teeth clean; insects get into them, and, horrible reptile though he be, he opens his jaws inoffensively to a faithful *dentistical* bird, who volunteers his beak for a toothpick.
Bulwer, My Novel, iv. 1. (*Davies.*)

The process of cutting teeth; teething.—2. The time during which teeth are being cut.—3. The kind, number, and arrangement of the teeth proper to any animal: as, the *carnivorous dentition*, in which the teeth are normally specialized as incisors, canines, premolars, and molars; the *rodent dentition*, in which some or all of the teeth grow indefinitely from persistent pulps,

the incisors are scalpriform, and canines are absent; the *monophyodont dentition*, in which there is but one set of teeth; the *diphyodont dentition*, in which there are two sets of teeth, etc. Many dentitions are known technically by the name of the genus or other group of animals to which they pertain, as the *diprotodont dentition*, the *polyprotodont dentition*, the *bunodont*, *bathmodont*, etc., the adjective in such cases being frequently applied to the animals themselves as well as to the number and arrangement of their teeth. See cuts under *acrodont* and *ruminant*. For formulas of dentition, see *dental formula*, under *dental*, *a.*

Greatly as the *dentition* of the highest ape differs from that of man, it differs far more widely from that of the lower and lowest apes. *Huxley*, Man's Place in Nature, p. 101.

weighings of numerous early coins, has been found equal to 43.7 grains troy, making the value of the coin about 9 United States cents; while the latter is said to be heavier in the ratio of 10 to 9, so that it would be 48 grains. This is still approximately the mass of the derham (weight) in most localities; though in some places it sinks nearly to 46 and in others rises almost to 50 grains, and in Abyssinia is even said to be only 40 or 41 grains. There was in early times a derham of half the usual weight, and two units of this name now employed in Persia are equal to nearly 150 and 300 grains respectively. The Morocco coin, the derham, is reckoned equivalent to 7½ United States cents.

The name was applied to a gallows, and then to a sort of crane. The name *Derrick* is < D. *Dierrijk*, contr. *Dirk*, earlier *Diederik*, also (after G.) *Dietrick* = OHG. *Diotrich*, MHG. G. *Dietrich* = AS. *Theódric* = Goth. **Thiudareiks* (Latinized *Theodoricus*, *Theodericus*), lit. chief of the people, < *thiuda* (= AS. *theód*, etc.), people, + *reiks* = AS. *rīce*, chief, mighty, rich: see *Dutch* and *rich*. It is similar to the crane, but differs from it in having the boom, which corresponds to the jib of the crane, pivoted at the lower end so that it may take different inclinations from the perpendicular. The weight is suspended from the end of the boom by ropes or chains that pass through a block at the end of the boom and thence directly to the *crab*, a winding-apparatus or motor at the foot of the post. Another rope connects the top of the boom with a block at the top of the post, and thence passes to the motor below. The motions of the derrick are a direct lift, a circular motion round the axis of the post, and a radial motion within the circle described by the point of the boom. On shipboard a derrick is a spar raised on end, with the head steadied by guys and the heel by lashings, and having one or more purchases depending from it to raise heavy weights.—**Floating derrick**, a movable derrick erected on a special boat or vessel. Such derricks have a single central post or support, and a horizontal boom supported at some elevation on the post and carrying a traveling carriage which bears the block from which the load is suspended. The boom is supported by stays from the top of the post, and is also counterbalanced by means of stays run from the opposite end of the boom to the deck of the vessel on which the derrick is built. The floating derrick used by the Department of Docks in New York has a lifting capacity of 100 tons, and a clear lift of 50 feet.

There are thirty-six orders of regular dervishes, who for the most part observe celibacy, and live in convents of not more than forty persons, under the supervision of a sheik or elder. Some, however, are permitted to marry and live with their families, but are required to spend at least two nights of each week in the monastery. The novitiate is severe, and the rules of the orders are strict. They are generally divided into two classes, viz.: *spinning* or *whirling dervishes* (*Mevlevis*) and *howling dervishes* (*Rufais*). To the violent circular dances and pirouetting of the spinning dervishes the latter add vociferous shouting and cries to Allah. The most important order of dervishes is that of the Mevlevis, whose monasteries (Turkish *tekye*) are found at Konieh in Asia Minor, at Constantinople, and elsewhere.

S.]—**Descriptive muster-roll.** See *muster-roll*.—**Descriptive** (opposed to *metrical*) **property** or **proposition,** in *geom.*, usually defined to be a property or proposition which can be stated without introducing the idea of magnitude. But it would be better to say that it is a property or proposition which relates to the incidence or coincidence of points, lines, and other geometrical elements, in general, or that it is one which does not depend upon the particular system of measurement adopted. Thus, the proposition that two triangles are equal if a side and two angles of the one are equal to the corresponding side and angles of the other, may be regarded as descriptive; while the proposition that through any point in space a single parallel to a given line can be drawn, is indisputably metrical, not descriptive.

> We have in the plane a special line, the line infinity; and on this line two special (imaginary) points, the circular points at infinity. A geometrical theorem has either no relation to the special line and points, and it is then *descriptive;* or it has a relation to them, and it is then metrical. *Salmon.*

Pertaining to or belonging to a desert; inhabiting a desert: as, the *desert* folk.—**Desert lands**, in the land law of the United States, lands which in their existing condition are unfit for cultivation, and are sold on easy terms on condition of being made cultivable within a certain period.

II. *n.* A desert place or region; a waste; a wilderness; specifically, in *geog.*, a region of considerable extent which is almost if not quite destitute of vegetation, and hence uninhabited, chiefly on account of an insufficient supply of rain: as, the *desert* of Sahara; the Great American *Desert*. The presence of large quantities of movable sand on the surface adds to the desert character of a region. The word is chiefly and almost exclusively used with reference to certain regions in Arabia and northern Africa and others lying in central Asia. (See *steppe*.) The only region in North America to which the word is applied is the Great American Desert, a tract of country south and west of Great Salt Lake, once occupied by the waters of that lake when they extended over a much larger area than they now occupy. The name *Great American Desert* was originally given to the unexplored region lying beyond the Mississippi, without any special designation of its limits. Colonel Dodge, U. S. A., says in "The Plains of the Great West" (1877): "When I was a schoolboy my map of the United States showed between the Missouri River and the Rocky Mountains a long and broad white blotch, upon which was printed in small capitals 'The Great American Desert — Unexplored.' . . . What was then regarded as a desert supports, in some portions, thriving populations." In Fremont's report the Great Basin is frequently spoken of as "the Desert." It is also called the *Great Desert Basin*.

=Syn. *Wilderness*, *Desert*. Strictly, a *wilderness* is a wild, unreclaimed region, uninhabited and uncultivated, while a *desert* is largely uncultivable and uninhabitable owing to lack of moisture. A *wilderness* may be full of luxuriant vegetation. In a great majority of the places where *desert* occurs in the authorized version of the Bible, the revised version changes it to *wilderness*.

A pathless *wilderness* remains
Yet unsubdued by man's reclaiming hand.

=Syn. 1. *Despondency*, *Despair*, *Desperation*. *Despondency* is a loss of hope sufficient to produce a loss of courage and a disposition to relax or relinquish effort, the despondent person tending to sink into spiritless inaction. *Despair* means a total loss of hope; *despondency* does not. *Despair* naturally destroys courage and stops all effort, but may produce a new kind of courage and fierce activity founded upon the sense that there is nothing worse to be feared. In this *despair* is akin to *desperation*, which is an active state and always tends to produce a furious struggle against adverse circumstances, even when the situation is utterly hopeless.

The calmness of his temper preserved him alike from extravagant elation and from extravagant *despondency*.

F. *dépêcher*, rid, discharge, hasten, expedite, despatch; cf. Sp. Pg. *despachar*, It. *dispacciare*, *spacciare*, *spicciare*, despatch, etc. If these forms had a common source, some confusion or corruption must have occurred in their development. According to the first explanation, *despatch* is coradicate with its equiv. *expede*, *expedite*, and their opposites *impede*, *impedite*: see *impeach*, in which the second syllable is the same as the second syllable of *depeach*, an obs. var. of *despatch*. 3. In *math.*, the sum of all the products which can be formed of a square block of quantities, each product containing as a factor one number from each row and one from each column of the block, and each product being affected by the plus or minus sign according as the arrangement of rows from which its factors are

taken (these factors being arranged in the order of the columns from which they are taken) requires an even or an odd number of transpositions to reduce it to the arrangement in the square. A determinant is conventionally denoted by writing the square block of quantities between two vertical lines. For example,

$$\begin{vmatrix} A, & B \\ a, & b \end{vmatrix} = Ab - aB.$$

$$\begin{vmatrix} A, & B, & C \\ a, & b, & c \\ \alpha, & \beta, & \gamma \end{vmatrix} = A b\gamma - A\beta c + a\beta C - abC + aBc - aB\gamma.$$

The different products of which a determinant is the sum are called its *elements*. The different quantities which are multiplied to form the elements are called the *constituents* of the determinant. The oblique line of places from the upper left-hand to the lower right-hand corner is called the *principal diagonal*. The conjugate line of places is called the *secondary diagonal*. The square root of the number of constituents is the ordinal number of the *order* or *degree* of the determinant.—**Adjugate determinant**, one each of whose elements is the cofactor of the corresponding term of the determinant to which it is adjugate.—**Axisymmetric determinant**. Same as *symmetric determinant*. See below.—**Bialar determinant**. See *bialar*.—**Bordered determinant**, a determinant whose matrix is formed from another by adding new rows and columns, especially where a single row and column are added, with a zero at their intersection.—**Centrosymmetric determinant**, one which is symmetric with respect to both diagonals.—**Characteristic determinant** of a matrix, the determinant of a matrix formed from the given matrix by adding the same indeterminate quantity to each constituent of the principal diagonal.—**Complementary determinant**, a determinant related to a partial determinant, to which it is said to be complementary, by having for its constituents all the constituents of the total determinant which belong to rows and columns from neither of which any constituent of the partial determinant has been taken, the sign of the complementary determinant being determined by taking its matrix as it stands in the lower right-hand corner of the matrix of the total determinant, when the matrix of the partial determinant has been brought to the upper left-hand corner, without altering the value of the total determinant.—**Composite determinant**, a sum of determinants whose matrices are obtained by successively omitting all the different combinations of n-columns from a rectangular block of quantities having m-rows and m- and n-columns. The composite determinant is usually denoted by writing its oblong matrix with two vertical lines on each side.—**Compound determinant**, a determinant whose constituents are themselves determinants.—**Cubic determinant**, a quantity formed on the analogy of a determinant proper from a cube of quantities as constituents.—**Cyclic determinant**. Same as *circulant*.—**Determinant of a linear transformation** or **substitution**, the determinant whose constituents are the coefficients of the equations of transformation regularly arrayed.—**Functional determinant**, one in which all the constituents in each row are differential coefficients of one quantity, while all the constituents in each column are differential coefficients with respect to one variable.—**Gauche determinant**. Same as *skew determinant*. See below.—**Minor determinant**, or **minor of a determinant**, a determinant whose matrix is formed from the matrix of another determinant by erasing part of the rows and columns. *First minor*, a minor formed by erasing one row and one column; *second minor*, a minor formed by erasing two rows and two columns, etc.—**N-dimensional determinant** of the r^{th} order, a function of r^{th} constituents, analogous to an ordinary determinant.—**Orthosymmetric determinant**, one all the constituents of which, having the sum of the ordinal places of the row and column the same, are equal.—**Partial determinant**. Same as *minor determinant*.—**Persymmetric determinant**, one which is symmetrical with reference to both diagonals.—**Reciprocal determinant**, a determinant each constituent of which is the corresponding first minor of the determinant of which it is the reciprocal.—**Skew determinant**, one in which every constituent of the i^{th} row and j^{th} column is in every case the negative of the one in the j^{th} row and i^{th} column, except on the principal diagonal. Also called *gauche determinant*.—**Skew symmetric determinant**, a skew determinant in which all the constituents of the principal diagonal vanish.—**Symmetric determinant**, one in which the constituent in the i^{th} row and j^{th} column is in every case equal to that in the j^{th} row and i^{th} column.—**Zeroaxial determinant**, one in which the constituents of the principal diagonal are all zeros. [The name *determinant* in a narrower sense was introduced by Gauss, and was first applied in the present sense by Cauchy.]

12. [ML. *determinatio quæstionis*, the answering a question, the posting of theses to be defended.] In Oxford and other old universities: (*a*) A solemn disputation in which the respondent is a bachelor of arts, and which is preparatory to graduation as master of arts. (*b*) A disquisition or other act substituted in recent times for the old disputation. The determinations were kept in Lent, and hence often called the *Lent determinations*. Originally, in the University of Paris (the model of most of the old universities of northern Europe, and especially of Oxford and Cambridge), there was but one degree, that of master of arts, carrying with it the right to lecture regularly in the university. The purpose of the determinations was to enable the masters to judge whether the candidate was fit to be presented to the chancellor as candidate for the mastership; and since there were no examinations, there was no other regular means of ascertaining the candidate's fitness. The baccalaureate was at first called the *determinance*, and was originally not a degree, nor conferred by the university, but merely a permission to *determine* or act as chief respondent in the Lent disputations, and was conferred by the "nation." In consequence of this inseparable connection between the baccalaureate and the determinations, the latter are often considered as conditions of the former, although they follow in time.

Hence—13†. A discussion of a question according to the scholastic method, after the model of a disputation.

Another diversity of Method, which is likewise of great weight, is the handling of knowledge by . . . "*dus*, *teuz*, a phantom, specter, goblin"; ML. "*dusius*, dæmo apud Gallos") is without sufficient support. Cf. LG. *dūs*, *duus*, G. *daus*, *taus*, used like the E. word: LG. *de duus!* G. *der daus!* the deuce! G. *was der daus!* what the deuce! *dass dich der daus!* deuce take you! Cf. Cf. LG. *de duks!* equiv. to E. *the dickens!* LG. *düker*, *deuker*, *deiker*, the deuce.] The devil: used, with or without the definite article, chiefly in exclamatory or interjectional phrases, expressing surprise, impatience, or emphasis: as, *deuce* take you! go to *the deuce!* *the deuce* you did!

The term *Devanagari*, which would mean the divine or sacred Nagari, is not used by the natives of India, and seems to have been invented by some ingenious Anglo-Indian about the end of the last century. It has, however, established itself in works on Indian Palæography, and may be conveniently retained to denote that particular type of the Nagari character employed in printed books for the sacred Sanskrit literature, while the generic term Nagari may serve as the designation of the whole class of vernacular alphabets of which the *Devanagari* is the literary type. *Isaac Taylor*, The Alphabet, II. 349.

2. In *biol.*, to cause to go through the process of natural evolution from a previous and lower stage, or from an embryonic state to a later and more complex or perfect one.

Where eyes are so little *developed* that approaching objects are recognized only as intercepting the sunshine, it is obvious that contrasts of light and shade which seem marked to animals with *developed* eyes are quite imperceptible. *H. Spencer*, Prin. of Psychol., § 92.

II. *intrans.* 1. To advance from one stage to another by a process of natural or inherent evolution; specifically, in *biol.*, to pass from the lowest stage through others of greater maturity toward the perfect or finished state: as, the fetus *develops* in the womb; the seed *develops* into the plant.

2. In *geom.*, reducible to a plane by bending: applied to a particular species of ruled surface, otherwise called a *torse*, which is conceived as formed by an infinite succession of straight lines, each intersecting the next.—**Developable helicoid.** See *helicoid*.

II. *n.* In *geom.*, a singly infinite continuous succession of straight lines, each intersecting the next; a torse. The word *developable* is used as a noun by modern geometers, because they do not consider this locus to be properly a surface. It is rather a skew curve regarded under a particular aspect. A developable is generated by a line which turns about a point in itself, while this point moves along the line. The locus of the point is a skew curve, called the edge of regression of the developable, to which the line is constantly tangent. The developable is thus the locus of tangents of a skew curve. Considering the osculating plane at any fixed point of this curve, the moving tangent comes up to this plane so that for an instant its motion is in the plane and then passes off; and the result is that the curve is a cuspidal edge of the developable considered as a surface.—**Polar developable** of a skew curve, the surface enveloped by its normal planes. The locus of the center of curvature of the skew curve is the edge of regression, while the axis of curvature is the generator of the polar developable.

developed (dē-vel'upt), *p. a.* [Pp. of *develop*, *v.*] 1. Unfolded; laid open; disclosed.—2. In *her.*, same as *disveloped*.

Specifically, in *photog.*, the chemical bath in which a sensitized plate or paper is, after a photographic exposure to the light, immersed to develop or bring out the latent image. Developers for the ordinary dry-plate process may be divided into two principal classes, *alkaline developers* and *ferrous-oxalate developers*, the first generally employing carbonate of soda or potash in combination with pyrogallic acid, and the second using oxalate of potash with protosulphate of iron. The results obtained are practically the same with either bath, the latent image in the film being made visible, and the chemical changes induced being *fixed*, or made permanent in the fixing bath, which follows the developing bath. Many other chemicals may be used in development, either in combination with some of those mentioned above or in independent combinations. See *photography*.

M. Balagny claims "that with this chemical he has developed plates without fog in such a light as would have been impossible . . . with other known *developers*."
Philadelphia Ledger, Feb. 28, 1888.

In *photog.*, the process by which the latent image in a photographically exposed sensitive film is rendered visible through a chemical precipitation on that portion of the sensitized surface which has been acted on by light. The matter deposited varies with the nature of the process. In the daguerreotype process it is mercury; in negative processes with salts of silver it is silver combined with organic matter.

Compasses are frequently elevated above the deck on tripods or masts to obviate the effects of the ship's magnetism, the direction and amount of which depends to a certain extent upon the position of the ship's head with reference to the points of the compass while building. In iron ships a careful determination of this error, with the ship's head on every point of the compass successively, is essential to safe navigation.—**Primary deviation,** in *ophthal.*, the deviation of the weaker eye from that position which would make its visual line pass through the object-point of the healthy eye.—**Secondary deviation,** in *ophthal.*, the deviation of the healthy eye from the position which would make its visual line pass through the object-point of the weaker eye.

[This use of the original term *διάβολος* occurs several times in the New Testament (1 Tim. iii. 11; 2 Tim. iii. 3; Tit. ii. 3), but this is the only instance in which, when so used, it is rendered *devil* in the English versions.]

2. In Christian theology, a powerful spirit of evil, otherwise called Satan (the adversary or opposer): with the definite article, and always in the singular. He is frequently referred to as the Evil One, the prince of the powers of the air, the prince of darkness, Beelzebub, Belial, the tempter, the old serpent, the dragon, etc. He is represented in the New Testament as a person, the enemy of God and of holiness, and bent on the ruin of man, but possessing only limited power, subordinate to God, able to operate only in such ways as God permits, and capable of being made subservient to God's will. In this respect he differs from Ahriman, the evil principle in the dualistic system of the Persians, who was coeval and coördinate with Ormuzd, the spirit of light and goodness, and from the devil of the Gnostic and Manichean systems. The medieval conception of the devil was largely derived from pagan mythology.

4. A false god; an idol. [In the authorized version of the Old Testament the word *devil* occurs four times: twice (Lev. xvii. 7; 2 Chron. xi. 15) translating Hebrew *sairim*, rendered in the revised version "he-goats" or "satyrs," and twice (Deut. xxxii. 17; Ps. cvi. 37) translating Hebrew *shedim*, rendered "demons" in the revised version. In the New Testament *δαιμόνιον*, or *demon*, is in one instance (see extract) rendered "devil," in the sense of an object of gentile worship, an idol, a false god.]

The most conspicuous illustration of devitrification is the production of "Réaumur porcelain" from glass by the long-continued action of heat. (See *porcelain.*) The term *devitrification* is much employed by lithologists in describing the changes which have taken place in rocks consisting originally, either wholly or in large part, of glass. (See *lava* and *obsidian.*) It may be the result of cooling, during which crystalline products have developed themselves in the glass in greater or less perfection; or it may have taken place in consequence of the action of water, either with or without the aid of heat, after the rocks had become solidified. Pressure is also regarded by many as being an agent of high importance. The changes thus indicated may be begun in a rock during its consolidation, and afterward continued under the combined influence of heat, water, and pressure, even to the entire obliteration of its original vitreous character, the result being the production of a purely lithoid structure. The minute forms developed in the process of devitrification, which are

Later geologists, however, do not use the terms as identical, the conditions under which the strata were deposited being very different.

=Syn. *Devote*, *Dedicate*, *Consecrate*, *Hallow*, destine, set apart. In *dedicate* and the cognate words *devote*, *devout*, etc., the root idea is always that of a complete mental consecration; thus, *devotion* (def. 2) is the consecration of the entire mind to God and his worship; and a *devout* (def. 1) spirit is one entirely absorbed in the worship or service of God. To *devote* indicates the inward act, state, or feeling; to *dedicate* is to set apart by a promise, and indicates primarily an external act; to *consecrate* is to make sacred, and refers to an act affecting the use or relations of the thing consecrated; to *hallow* is to make holy, and relates to the character of the person or thing hallowed. Thus, we *devote* ourselves by an act of the mind; we *dedicate* our lives or property by a more formal act; we *consecrate* to sacred uses a building not before sacred; and we *hallow* the name of God, recognizing in it its inherent holy character.

Dew is thus deposited chiefly on bodies which are good radiators and poor conductors of heat, like grass; hence also it appears chiefly on calm and clear nights—that is, when the conditions are most favorable for radiation. See *saturation*. The more humid the atmosphere, the less the difference between its temperature and that of the dew-point, and vice versa. When the air is saturated with moisture and any colder body is brought into contact with it, deposition of moisture or dew immediately takes place on its surface. See *hygrometer*.

When a body of moist air is cooled, the point of saturation is gradually reached; and when saturated, any further cooling causes a deposition of dew: hence the temperature at which this occurs is called the *dew-point*.

Brongniart to a rock which Haüy later designated as *diorite*, which name Brongniart himself adopted in preference to that of *diabase*. Later (in 1842) Hausmann again introduced the word *diabase*, and by it designated a variety of pyroxenic rock, occurring in the Harz, and characterized by the presence of chlorite in considerable quantity. At the present time the name *diabase* is used to designate a crystalline-granular rock, consisting essentially of augite and a triclinic feldspar, with more or less magnetite or titaniferous iron, or both, and occasionally apatite or olivin, to which is added chloritic matter in varying amount. To this chloritic material the name *viridite* is frequently applied, this being the substance which gives the mass the greenish color which it frequently has. Diabase is one of the rocks included under the popular designation of *greenstone*, and also under that of *trap*. It is an altered form of basalt. "The main difference between *diabase* and *basalt* appears to be that the rocks included under the former name have undergone more internal alteration, in particular acquiring the diffused 'viridite' so characteristic of them" (*Geikie*, 1885). See *greenstone*, *trap*, *diorite*, and *melaphyre*.

The former is distinguished by the presence of an excessive quantity of sugar in the urine, and to it there is a strong tendency to restrict the name. Light and evanescent grades of glucosuria are not considered as diabetes, and doubtless frequently have an entirely different causation. The disease is chronic and generally fatal. Its essential pathology is unknown. It is not an affection of the kidneys, but depends upon the accumulation of sugar in the blood, or glucohemia. (See *glucosuria*.) Diabetes insipidus, or polyuria, is characterized by the discharge of abnormally large quantities of ordinary or watery urine.

by parallel lines drawn obliquely at equal distances across the parallels. Such a scale facilitates laying down small fractions of the unit of measurement. Thus, if, in the figure, the distance from 0 to 10—one inch—is divided into 10 equal parts, the diagonal which ends at 0 cuts off upon the parallel lines $\frac{1}{10}$, $\frac{2}{10}$, etc., inch respectively; the next diagonal cuts off $\frac{1}{100}$, $\frac{2}{100}$, etc.—**Diagonal triangle,** a triangle formed by the three diagonals of a complete quadrilateral, or the three diagonal points of a quadrangle.

2. One of a number of related modes of speech, regarded as descended from a common original; a language viewed in its relation to other languages of the same kindred; the idiom of a district or class, differing from that of other districts or classes. Thus, the Scotch is a dialect of English; English is a dialect of the Germanic or Teutonic group; Germanic speech is an Aryan or Indo-European dialect. Of the various dialects of Greek—Attic, Ionic, Doric, Æolic, and so on—the Attic finally became the common dialect of all cultivated Greeks. Every literary language is originally one of a body of related dialects, to which favoring circumstances have given vogue and general acceptance.

Sw. *dialektik*, < L. *dialectica*, < Gr. *διαλεκτική* (sc. *τέχνη*), the dialectic art, the art of discussion, logical debate, also the logic of probabilities, fem. of *διαλεκτικός*, belonging to disputation: see I.] **1.** Logic, or a branch of logic; specifically, the art of critical examination into the truth of an opinion; inductive logic applied to philosophy; the logic of probable reasoning; the art of discussion and of disputation; logic applied to rhetoric and refutation. The invention of the art of dialectic is attributed to Zeno the Eleatic, whose arguments against motion are examples of the original meaning of the Greek word. The famous dialectic of Socrates and Plato, their chief instrument of philosophical inquiry, was a conversational discussion with inductive appeals to special instances. Dialectic was limited by Aristotle to logic accommodated to the uses of the rhetorician, appealing only to general belief, but not to first principles. The Stoics, who probably introduced the term *logic*, divided that art into rhetoric and dialectic, the former being the art of continuous discourse, the latter that of discussion with an interlocutor. Cicero and other Latin writers, influenced by Stoic doctrine, understand by dialectic "the art of discussing well" (*ars bene disserendi*). It thus became the name of that branch of the trivium of the Roman schools which we call logic, and retained that meaning throughout the middle ages. Hence, in all the earlier English literature, it is the synonym of *logic*, differing from that word only by a more distinct suggestion of the idea of disputation. Modern logicians have frequently restricted it to the doctrines of the Topics and Sophistical Elenchi, or to the former alone. It has also been used as a synonym of *syllogistic*. Kant named the constructive part of his Transcendental Logic *transcendental analytic*, and the destructive part *transcendental dialectic*. For the sake of this phrase, he makes dialectic, in general, the theory of fallacies. According to Hegel, each concept in the development of thought by a primitive necessity develops its own diametrical opposite, and to this reaction of thought against itself, regarded not as final, but as subject to a subsequent reconcilement in a higher order of thought, he gave the name of *dialectic*.

This is done by pouring a mixed solution of crystalloid and colloid on a sheet of parchment-paper stretched over a wooden or gutta-percha hoop, having its edges well drawn up and confined by an outer rim. The parchment is allowed to float in a basin of water. Diffusion immediately commences, the crystalloid passing through and dissolving in the water beneath, while the colloid remains behind. Thus, gruel or broth containing a very little arsenic dissolved in it gives up the whole of its arsenic to the water, while scarcely a trace of the organic substance passes through. As almost all the poisons in common use—arsenic, corrosive sublimate, oxalic acid, lead acetate, morphia, and salts of strychnine, etc.—are crystalloids, the toxicologist is by this process furnished with an easy mode of detecting their presence, if they are in a form readily soluble in water.

II. *n.* A substance which is diamagnetic in a magnetic field of force. See *diamagnetism*, 1.

diamagnetism (dī-a-mag′net-izm), *n.* [= F. *diamagnétisme*; as *diamagnet-ic* + *-ism*.] 1. The phenomena exhibited by a class of substances which, when under the influence of magnetism and freely suspended, take a position with the longer axis at right angles to the magnetic lines of force. From the experiments of Faraday it appears to be clearly established that all matter is subject to the magnetic force as universally as it is to the gravitating force, arranging itself into two divisions, the *paramagnetic* and the *diamagnetic*. Among the former are iron, nickel, cobalt, palladium, titanium, and a few other substances; and among the latter are bismuth, antimony, cadmium, copper, gold, lead, mercury, silver, tin, zinc, and most solid, liquid, and gaseous substances. When a paramagnetic substance is suspended freely between the poles of a powerful horseshoe magnet, it points in a line from one pole to the other, which Faraday terms the *axial line*. On the other hand, when a diamagnetic substance is suspended in the same manner, it is repelled alike by both poles, and assumes an equatorial direction, or a direction at right angles to the axial line.

The magnetism of two iron particles lying in the line of magnetization is increased by their mutual action, but, on the contrary, the *diamagnetism* of two bismuth particles lying in this direction is diminished by their mutual action. *J. E. H. Gordon*, Elect. and Mag., II. 21.

If, however, the magnetism of the molecules were so much increased that they held each other tight, and so could not be turned round by ordinary magnetizing forces, it is shown that effects would be produced like those of *diamagnetism*. *W. K. Clifford*, Lectures, I. 241.

In *geom.*, a chord of a circle or a sphere which passes through its center; in general—(*a*) a chord of a conic cutting it at points tangents to which are parallel; (*b*) a line intersecting a quadric surface at points where the tangent planes are parallel. The conception was extended by Newton to other algebraic curves by means of the following theorem: If on each of a system of parallel chords of a curve of the *n*th order there be taken the center of mean distances of the *n* points where the chord meets the curve, the locus of this center is a straight line, which may be called a *diameter* of the curve.

2. A precious stone, distinguished from all others by being combustible and by its extreme hardness, as well as by its superior refractive and dispersive power. It consists of pure or nearly pure carbon, leaving only a very small quantity of ash when burned. Its specific gravity is about 3½; its crystalline form is the isometric, and it cleaves readily in planes parallel to the faces of the regular octahedron. Natural crystals are found in a great variety of forms belonging to the isometric system. The crystalline planes of the diamond have this peculiarity, that they are frequently more or less convex, instead of being flat, as those of crystals usually are. The range of color of the diamond is extensive, but hues of light yellow, or straw-color, and brown are of most common occurrence. Diamonds of a decided color, such as green, blue, or even red, are found, but they are extremely rare; only one deep-red diamond is known. A diamond is of the *first water* when it is without flaw or tint of any kind. The value of the gem increases in an increasing ratio with its weight up to a moderate size; beyond that there is no fixed value. A first-water diamond of one carat being considered worth $100, one of two carats would be held at $300, and one of ten at $11,000. The most desirable form in which the diamond may be cut is called the *brilliant*. (See cuts under *brilliant*.) Diamonds formerly came chiefly from India, and later from Brazil; the present principal source of supply is southern Africa, where they are found associated with a peculiar rock of unequivocal volcanic origin. In all other diamantiferous regions diamonds have been found only in the surface detrital material (gravel and sand), or else, rarely, in rock of fragmental origin. See *bort*.

diamond-cutting (dī′a-mond-kut′ing), *n.* One of three processes by which diamonds are prepared for use as ornaments or in the arts, the others being diamond-cleaving and diamond-polishing. Diamond-cutting is performed by rubbing together two diamonds secured with shellac in wooden holders or handles, one of which is held in each hand of the cutter over the edge of a box called a cutters' box, into which the dust is allowed to fall. This rubbing is continued until each diamond assumes the proper outline, whether brilliant, rose, or briolette, the smaller facets being afterward made by polishing. Both stones are cut at the same time, irrespective of size or shape, or of the outline to be produced. Diamond-cutting is sometimes performed by machinery. In this case one of the handles or dops is stationary and the other is moved backward and forward, both diamonds being cut at the same time, but more rapidly and accurately than by hand.

(*b*) A ring, or a plate pierced with a circular hole so arranged as to fall in the axis of the instrument, used in optical instruments to cut off marginal beams of light, as in a camera or a telescope. Such diaphragms are often made movable, especially for photographic lenses, so that one with a large opening may be inserted when it is desired to admit abundant light to the lens, in order to use a short exposure, and one with a small opening when sharpness of detail is more desirable than shortness of exposure.

3. In *anat.,* the midriff; the musculomembranous partition which separates the thoracic from the abdominal cavity in mammals. In man the diaphragm consists of a muscular sheet whose fibers radiate from a trefoil tendinous center to attach themselves to the lower margins of the thorax, and behind form a large bundle on either side, called *pillars of the diaphragm.* The diaphragm is pierced by three principal openings: the *esophageal,* for the passage of the esophagus accompanied by the pneumogastric nerves; the *aortic,* for the passage of the aorta, thoracic duct, and large azygous vein; and the *caval,* for the inferior vena cava; besides some others for splanchnic nerves, etc. The diaphragm is invested on its thoracic surface by the pleural and pericardial serous membranes; on its abdominal surface by the peritoneum, a fold of which, reflected upon the liver, forms the suspensory ligament of that organ. The diaphragm is deeply concavo-convex, the convexity upward; the general figure is that of an umbrella. It is a powerful respiratory muscle, contracting at each inspiration and so flattening, while its relaxation in expiration renders it more convex; its contraction also assists in defecation and in parturition, and its spasmodic action is concerned in hiccough and sneezing; when most relaxed it rises to the level of about the fifth rib. A rudimentary diaphragm exists in birds; it is best developed in the apteryx.

Also written *diasceuast.*

I should be inclined to suspect the hand of the *diaskeuast* in this passage more than in almost any other of the poems. *Gladstone*, Studies on Homer, II. 83.

But these fables only purport to be Babrius spoiled, after having passed through the hands of a *diasceuast:* that is, some late writer who has turned his verses into barbarous Greek and wretched metre. *Encyc. Brit.*, III. 181.

Diaspinæ (dī-as-pī'nē), *n. pl.* [NL., < *Diaspis* + *-inæ.*] A subfamily of *Coccidæ*, typified by the genus *Diaspis;* the scale-lice. Also written *Diaspina.*

diastase (dī'a-stās), *n.* [< F. *diastase*, diastase, lit. separation (see def.), < Gr. *διάστασις*, separation: see *diastasis.*] A substance existing in barley, oats, wheat, and potatoes after germination. It is obtained by digesting in a mixture of three parts of water and one of alcohol, at a temperature of 113°, a certain quantity of germinated barley ground and dried in the open air, and then putting the whole under pressure and filtering it. Diastase is solid, white, and soluble in water and diluted alcohol, but insoluble in strong alcohol. In solution it possesses the property of causing starch to break up at the temperature of 150°, transforming it first into dextrin and then into sugar.

diastema (dī-a-stē'mä), *n.*; pl. *diastemata* (-ma-tä). [LL., an interval, esp. in music, < Gr. *διάστημα*, an interval, difference, < *διαστῆναι*, separate: see *diastasis.*] **1.** In *zoöl.* and *anat.*, an interval between any two consecutive teeth, especially between any two series or kinds of teeth, as between the canines and premolars or incisors, or among the incisors, as in many bats. When there are no canines, as in rodents, diastema occurs between the incisors and the premolars. It necessarily occurs when opposing teeth are so long that they cross each other when the mouth is shut. Man is notable as having normally no diastemata, his teeth forming a continuous series, and being all of approximately equal lengths. But the same is the case with some other mammals, as in the genera *Tarsius* and *Anoplotherium.*

2. In *anc. Gr. music*, an interval. Also *diastem.*

diaster (dī-as'tėr), *n.* [< Gr. *δι-*, two-, + *ἀστήρ*, star.] In *biol.*, a double star; the caryocinetic figure which results from the aster of a nucleus before this separates into two nuclei. See *aster* and *caryocinesis.* Also *dyaster.*

diastole (dī-as'tō-lē), *n.* [LL., < Gr. *διαστολή*, dilatation, expansion, lengthening of a syllable, < *διαστέλλειν*, dilate, expand, put asunder: see *diastaltic.*] **1.** The normal rhythmical dilatation or relaxation of the heart or other blood-vessel, which alternates with *systole* or contraction, the two movements together constituting pulsation or beating: as, auricular *diastole;* ventricular *diastole.* The term is also extended to some other pulsating organs, as lymph-hearts, and specifically to the expanding action of the contractile vesicle of infusorians and other protozoans.

2. The period or length of time during which a rhythmically pulsating vessel is relaxed or dilated; the time-interval which alternates with systole.—**3.** In *Gr. gram.*, a mark similar in position and shape to a comma, but originally semicircular in form, used to indicate the correct separation of words, and guard against a false division, such as might pervert the sense. Such a sign was needed to obviate the confusion arising from the ancient practice of writing without division between words. The diastole is still occasionally used, generally in order to distinguish the pronominal forms ὅ,τι and ὅ,τε, 'whatever, which,' from the particles ὅτι, 'that,' and ὅτε, 'when.' The usual practice at present, however, is to use a space instead of the diastole. When the present shape of the comma came into use, more or less confusion between it and the diastole necessarily ensued. Also called *hypodiastole.* See *hyphen.*

4. In *anc. pros.*, lengthening or protraction of a syllable regularly short; especially, protraction of a syllable preceding a pause or taking the ictus: as,

Ire negabamūs et tecta ignota subire.
Ovid, Metamorph., xiv. 250.

Most cases of diastole in Latin poetry are supposed to be instances of reversion to an older pronunciation, though the pause which usually follows could of itself make good the metrical deficiency. This reversion is seen chiefly in verb-terminations with final *t* and *r*: as,

Callidus ut soleăt humeris portare viator.
Horace, Satires, I. v. 90.

As understood by recent naturalists, it is limited to *Diastylis* and *Leptostylis*; these have the integuments strongly indurated, body and tail sharply defined, and the carapace large and vaulted, with a conspicuous rostriform prominence.

The cells are either isolated or united into threads, etc., and often secrete a thin jelly in which they live socially. Each frustule is composed of two separate and similar parts (valves), the edges of which usually fit one over the other like the lid of a box. Reproduction takes place, as in the desmids, in two ways, by division and by sexual conjugation. Diatoms exist in all parts of the world in immense numbers at the bottom of the sea and of fresh water, and are also found attached to the submerged parts of aquatic plants, etc., and among mosses and in other damp localities? There are many genera, and the number of known species exceeds 1,500. They vary greatly in the form and markings of the valves, which are often exquisitely sculptured, forming beautiful objects under the microscope and testing its highest powers. In some species the lines are found to equal 125,000 to the inch. Extensive fossil deposits of the silicious remains of *Diatomaceæ* occur in various localities, as at Bilin in Bohemia, and in Virginia, Nevada, and California. They are sometimes used as polishing-powder. They are abundant in guano. Also called *Bacillariaceæ*.

The leaf in Dracunculus has a very peculiar shape: it consists of a number of lobes which are disposed upon a stalk which is more or less forked (tends more or less to *dichotomise*). *Nature*, XXX. 272.

Also spelled *dichotomise*.

Take the classification of the sciences, and it is seen that the process begins at its widest sweep with a pure *dichotomous* division: it is the contrast of the Abstract and the Concrete. *W. L. Davidson*, Mind, XII. 251.

Specifically—(*a*) In *bot.*, regularly dividing by pairs from below upward; two-forked: as, a *dichotomous* stem. A good example of a dichotomous stem is furnished by the mistletoe. See cut under *dichotomy*.

It is in this manner that the *dichotomous* character is given to the entire stipes. *W. B. Carpenter*, Micros., § 294.

(*b*) In *zoöl.*: (1) Branching by pairs; biramous; bifurcate; forked: as, the *dichotomous* division of a deer's antlers; the *dichotomous* foot of a crustacean. (2) Distichous; bifarious; two-rowed or two-ranked; parted in the middle: as, the *dichotomous* hairs of a squirrel's tail. (*c*) In *classification*, binary; dual; arranged in two ranks or series; opposed by pairs, as a set of characters, or a number of objects characterized by dichotomization. Also *dichotomic*.—**Dichotomous key** or **table**, in *nat. hist.*, a tabular guide to the orders, genera, etc., as of a flora, arranged artificially, so that by a series of contrasts and exclusions the desired order is finally reached.

dichotomously (dī-kot'ō-mus-li), *adv.* In a dichotomous manner; by subdivision into two parts or into pairs. Also *dichotomically*.

All the Sauropsida possess a larynx, a trachea, and one or two lungs. The bronchi do not divide *dichotomously*, as they do in Mammalia. *Huxley*, Anat. Vert., p. 267.

dichotomy (dī-kot'ō-mi), *n.*; pl. *dichotomies* (-miz). [< Gr. *διχοτομία*, a cutting in two, < *διχότόμος*, cutting in two: see *dichotomous*.] A cutting in two; division into two parts or into twos; subdivision into halves or pairs; the state of being dichotomous.

Nor contented with a general breach or *dichotomy* with their church, [they] do subdivide and mince themselves almost into atoms. *Sir T. Browne*, Religio Medici, i. 8.

Specifically—(*a*) In *logic*, the division of a whole into two parts; binary classification. Ramus revived, against the Aristotelians, the Platonic doctrine, which has had many adherents, that all classification should be by dichotomy. But the opinion has found little favor since Kant.

We cannot by any logical *dichotomies* accurately express relations which, in Nature, graduate into each other insensibly. *H. Spencer*, Prin. of Biol., § 75.

(*b*) In *astron.*, that phase of the moon in which it appears bisected or shows only half its disk, as at the quadratures. (*c*) In *bot.*, a mode of branching by constant forking, as is shown in some stems, the venation of some leaves, etc. This mode of branching in plants is variously modified, as when only one of the branches at each fork becomes further developed, in which case the dichotomy is said to be *sympodial*. If these undeveloped branches lie always upon the same side of the axis, the sympodial dichotomy is *helicoid*; if alternately upon opposite sides, it is *scorpioid*. – **Argument from dichotomy**, one of the arguments of Zeno the Eleatic against plurality and magnitude. Anything having magnitude must consist of two parts, and those again of two, *ad infinitum*. Thus, the ultimate parts have no magnitude, and hence not the whole.

dichroism (dī'krō-izm), *n.* [< *dichro-ic* + *-ism*.] In *optics*: (*a*) A property possessed by many doubly refracting crystals of exhibiting different colors when viewed in different directions. Thus, palladium chlorid appears of a deep-red color along the axis, and of a vivid green when viewed in a transverse direction. Mica affords another example, being nearly opaque when viewed in one direction, but transparent and of a different color in another. This property is due to the difference in the absorption of the light-vibrations in the different directions. See *pleochroism*. (*b*) The exhibition of essentially different colors by certain solutions in different degrees of dilution or concentration.

dichroistic (dī-krō-is'tik), *a.* [< *dichro-ism* + *-istic*.] Having the property of dichroism. Also *dichroous*.

See *color-variation*.
